Preface

The study reported herein was conducted by the Environmental Laboratory (EL) of the U.S. Army Engineer Waterways Experiment Station (WES). The research was sponsored by the Department of the Army Installation Restoration Research Program (IRRP). Dr. Clem Meyer was the IRRP Coordinator at the Directorate of Research and Development, Headquarters, U.S. Army Corps of Engineers (HQUSACE). Dr. Bob York of the U.S. Army Environmental Center (USAEC) and Mr. Jim Baliff of the Environmental Restoration Division, Directorate of Military Programs, HQUSACE, served as the IRRP Overview Committee. Technical Monitors were Ms. Sandra Cotter of the U.S. Army Engineer Division, Missouri River, and Mr. Wayne Sisk of USAEC. The WES Program Manager was Dr. John Cullinane.

This report was prepared by Dr. Thomas D. Wright of the Fate and Effects Branch (FEB), EL. The work was conducted under the direct supervision of Dr. Bobby L. Folsom, Jr., Chief, FEB, and under the general supervision of Mr. Donald L. Robey, Chief, Environmental Processes and Effects Division, and Dr. John Harrison, Director, EL.

At the time of publication of this report, Director of WES was Dr. Robert W. Whalin. Commander was COL Bruce K. Howard, EN.

This report should be cited as follows:

Summary

Concern has been expressed that grouts used to seal cone penetrometer holes and soluble tracers used in conjunction with penetrometer investigations might introduce contaminants into groundwater and thereby pose a potential environmental hazard. A risk assessment approach was used to evaluate this potential. For the effects phase of the assessment, data were obtained for representative inorganic (clays, cement, and chemical) and organic (urethane) grouts and a fluorescent tracer. Based on information found in material safety data sheets, environmental hazards from the grouts and the tracer were not found to be significant with the possible exception of oral ingestion of undiluted or unreacted components. The exposure phase of the assessment was not conducted because no significant effects were identified. The selected grouts and the tracer are recommended for use with cone penetrometer investigations. Grouts or tracers other than those evaluated will require material-specific evaluation.
1 Introduction

Background

The Site Characterization and Analysis Penetrometer System (SCAPS) was developed by the U.S. Army Engineer Waterways Experiment Station to investigate terrestrial hazardous and toxic waste (HTW) sites. The system is mounted on a truck and is capable of pushing a 3.56-cm rod into the ground to a depth of 45 m. Following penetration, the rod is withdrawn and the hole is grouted to prevent potential horizontal and vertical migration of HTW contaminants. On occasion, a tracer may be introduced into the penetrometer hole to monitor groundwater movement.

Although one of the purposes of the grout is to prevent potential migration of contaminants resulting from the penetrometer hole, concerns have been raised that the grout itself or the tracer might potentially constitute a source of contamination. This could occur if the penetrometer entered groundwater, and contaminants present in the grout or tracer could be directly introduced into the groundwater. Leaching and subsequent contamination is also possible. An environmental hazard through oral ingestion of the contaminants in groundwater might result. Of course, failure of the grout could result in a direct contamination of the groundwater by HTW contaminants at the site, but that is outside the scope of this report. This report will address only the potential direct effects of oral ingestion of contaminants which might be released into groundwater by selected grouts used to plug and/or seal cone penetrometer holes or by the introduction of a selected tracer. Work Unit AF25-CT-002, Biological Evaluation of Materials Used in Cone Penetrometer Grouting and Tracer, was developed to address this potential source of contamination.

SCAPS development was initiated in 1986. Because of equipment limitations, it was originally believed that multicomponent organic grouts would be required for successful grouting through the 3.56-cm penetrometer rod. The organic chemicals used in these grouts can have potentially adverse health and

---

environmental impacts, and the products of incomplete polymeric reactions may complicate site characterization. Anticipated resistance to the use of synthetic grouts by Federal and state regulatory agencies necessitated planning for the environmental effects assessment of the grouts proposed for use with the SCAPS. As discussed below, field experience during the past 2 years has demonstrated that the environmental effects issue has been largely overcome by events.

First, cement and bentonite grouts are commonly specified a priori by Federal and state regulatory agencies as the most appropriate grouts for use on uncontrolled hazardous waste sites.\(^1\) These grouts are commonly used during installation of conventional site characterization monitoring wells, and the regulators have significant experience in their use. Further, since these grouts are composed of commonly used construction materials, their environmental effects are considered to be relatively benign.

Second, field trials have proven the technical feasibility of using the more conventional cement- and bentonite-based grouts with the SCAPS. In addition, private sector vendors have successfully used cement- and bentonite-based grouts with cone penetrometer systems.\(^2\)

Third, there are no documented cases in which environmental effects associated with grouts have resulted in delay or cancellation of a SCAPS project. Grout environmental effects issues have been successfully resolved through discussions with appropriate regulating agencies.\(^2\)

Finally, experience with Federal and state regulators has not led to the development and execution of a universally acceptable environmental effects evaluation protocol for the synthetic-based grouts. Site-specific conditions and regulatory preferences appear to necessitate the use of site-specific protocols, e.g., some regulators have suggested the necessity for using site groundwater to conduct any leaching/toxicology tests.\(^2\) Carried to its extreme, this philosophy would require separate site-specific environmental effects studies for each site on which the SCAPS is used.

The developments described above have, to a large extent, obviated the need for conducting environmental assessments on a large number of grouts or developing grouts specifically for the SCAPS. It is prudent to conduct an environmental effects review of the grouts and tracers that are currently anticipated to be used with the SCAPS to assist in obtaining regulatory approval for its use.

2. Personal Communication, 1992, Stafford Cooper, U.S. Army Engineer Waterways Experiment Station, Vicksburg, MS.
Objective

The objective of this report is to assess the potential of selected grouts and a tracer used in conjunction with the SCAPS for contaminating groundwater. Because a variety of grouts and tracers were originally proposed, a generic list considering operational considerations and planned use was developed by the SCAPS team. Grouts and tracers not included in this generic list will require material-specific consideration. The generic grouts and the tracer are

a. Bentonite clay.

b. Attapulgite clay.

c. Microfine portland cement.

d. Joosten grout (calcium silicate grout).

e. Urethane grout.

f. Fluorescent tracer.

Approach

The approach chosen to evaluate the potential problem is a risk assessment. The risk assessment has two components—effects assessment and exposure assessment. The effects assessment will address potential health effects such as chronic and acute toxicity, carcinogenicity, mutagenicity, and teratogenicity. The primary sources of this information are the material safety data sheets (MSDS) required by the Occupational Safety and Health Administration (OSHA) as per 29 CFR 1910.1200. These data sheets are provided by the manufacturer or supplier. If the effects assessment warrants, an exposure assessment should be performed.

The primary items of interest in the MSDS are Sections 2 (Hazardous Ingredients) and 5 (Health Information). In some instances the information provided is not pertinent to this report as, for example, inhalation or dermal contact with unreacted components. Where a potential health hazard is indicated, it is necessary to determine the route of exposure. Further, the manufacturer/supplier is not required to provide information where a particular route of exposure is unlikely, such as the oral ingestion of concrete. As noted above, only oral ingestion through groundwater is considered in this report. In Chapter 2, the grouts and the tracer used in conjunction with the SCAPS are assessed with regard to their potential for groundwater contamination. Each MSDS is reproduced in Appendix A.
2 Results

Each MSDS was assessed regarding the potential of the material to contaminate groundwater. Results of this analysis are summarized below.

- **Bentonite clay.** Information was obtained from Baroid Drilling Fluids, Inc., on three bentonitic clay products (trade names: Benseal, Aquagel, and Aquagel Gold Seal). In addition, information was obtained on a catalyst, Aqua-Grout Catalyst.

- **Attapulgite clay.** Information was obtained from Baroid Drilling Fluids, Inc., on an attapulgite clay product (trade name: Zeogel).

- **Microfine portland cement.** Information was obtained for two microfine portland cements. Lehigh Geocem is manufactured by Lehigh Portland Cement Company, and Micro Matrix Cement is sold by Halliburton Services, Inc.

- **Joosten grout.** Joosten grout consists of calcium silicate. It is formed by the reaction of sodium silicate and calcium chloride to form calcium silicate and sodium chloride. Information on all these compounds was obtained from Sax as well as the material safety data sheets. No MSDS on sodium chloride exists, as it is not regulated by OSHA.

- **Urethane grout.** Information was obtained for three urethane grouts and their catalysts. Mountain Grout and its catalyst, Pure Catalyst, is marketed by Green Mountain, Inc. TACSS 020 NF/TACSS 025 NF and its catalyst, TACSS Accelerator C-852/C-855, is manufactured by De Neef America, Inc. Scotch-Seal 5600 is manufactured by Minnesota Mining and Manufacturing (3M).

- **Fluorescent tracer.** Information was obtained on one fluorescent tracer. Fluoretract II is manufactured by Formulabs, Inc.

---

3 Discussion and Conclusions

Grouts, as classically employed, are used to fill holes, cracks, and voids in structures or as sealants. These include concrete structures such as water supply reservoirs and distribution systems. Grouts for such purposes should not be a source of contaminants. Further, by definition, grouts should have little solubility in water, and any trace contaminants present should be sequestered in the cured grout matrix. During the curing process grouts may produce or release substances that may be deleterious, but this should be minimal. After curing, a very small amount of surface leaching from the grout may occur. Grouts are very commonly used to plug or seal abandoned oil, gas, and water wells and borings for geological, mineral, foundation, and other exploratory purposes. The grout prevents the horizontal and vertical movement of water and other fluids or gases. As noted in Appendix B, many States provide guidance on particular grouts for specific purposes. These consist primarily of bentonite clays, cement, or combinations of the two.

Tracers are used to determine the movement of fluids. Tracers may be introduced into reservoirs, groundwater, rivers, or water distribution systems. When properly used, they are not considered to be contaminants. A very common application is their introduction into drain fields to determine the movement of effluents.

Bentonite Clay

This inorganic material is also known as Wyoming bentonite or sodium montmorillonite and is a sodium aluminum silicate. The only hazardous ingredient listed on the MSDS for the three formulations and the catalyst is silica. There is no indication of adverse effects from oral ingestion. One formulation, Benseal, is specifically recommended for sanitary sealing during water well construction, and all metals are within drinking water standards as determined by the U.S. Environmental Protection Agency’s Toxicity Characteristics Leaching Procedure.
Attapulgite Clay

This inorganic material is a magnesium aluminum silicate. The only hazardous ingredient listed on the MSDS is silica. There is no indication of adverse effects from oral ingestion.

Microfine Portland Cement

This inorganic material consists of various calcium silicates, aluminates, and similar calcium salts that are not readily separable into individual components. Because it is manufactured from raw materials mined from the earth, trace (but detectable) amounts of many naturally occurring elements and compounds may be found by chemical analysis. The only hazardous ingredient listed on the MSDS is silica, and there is no indication of adverse effects from oral ingestion.

Joosten Grout

This inorganic grout is produced by the reaction of sodium silicate and calcium chloride to form calcium silicate and sodium chloride. The usual procedure in using this grout is for the operator to obtain the reaction products in bulk and inject them into the cavity. The reaction is very rapid, and injection consists of both liquids being simultaneously introduced while the injection tubes are withdrawn. Calcium chloride and calcium silicate are food additives. Calcium chloride and sodium silicate also migrate into food from packaging materials. Sodium chloride is commonly known as table salt. The toxic hazard rating code for all of these compounds for oral ingestion is I (slight: causes readily reversible changes that disappear after end of exposure). As with all salts of this nature, oral ingestion of extremely large quantities (thousands of milligrams per kilogram) can be lethal.

Urethane Grout

These organic grouts are urethane polymers (polyurethanes). Hazardous ingredients listed on the MSDS for these polymers and their catalysts include aliphatic amines, methylene diphenyl isocyanate, toluene diisocyanate, free isocyanate, acetone, and polyether prepolymer. Unreacted toluene diisocyanate is a potential carcinogen. However, after the curing process is complete, all three proprietary products are approved for potable water contact. The

---

MSDS recommends that a physician be called in the event of oral ingestion of unreacted components. This would not apply to the cured grout itself.

All of the selected grouts have potential adverse effects from inhalation and/or dermal exposure. These are limited to the exposure to components, rather than to the final grout mixture. For example, cement can cause severe chemical burns as it is a highly caustic compound. However, the end product, concrete, is essentially inert. Likewise, the silica in cement dust is a possible carcinogen and is known to cause lung inflammation and silicosis. Adequate ventilation and other protective measures are necessary during the use of the selected grouts to prevent or minimize exposure to particulates, fumes, or vapors through inhalation.

Fluorescent Tracer

The MSDS for this organic tracer indicates that no hazardous ingredients are present. Oral ingestion of the concentrate may cause nausea or result in yellow-green urine until the tracer has been flushed from the system. No adverse effects are expected from either acute or chronic exposure. This organic tracer is not carcinogenic, teratogenic, or mutagenic.

Conclusion

Effects assessment of several representative grouts and a tracer proposed for use with the SCAPS showed that environmental hazards from grout or tracer-associated contaminants are of little significance. This being the case, exposure assessment is not necessary. The selected grouts, and especially those required by the States (Appendix B), are recommended for sealing SCAPS borings.

ROUTES OF EXPOSURE AND EFFECTS

THIS PRODUCT CONTAINS FREE CRYSTALLINE SILICA WHICH ACCORDING TO THE IARC HAS EXHIBITED LIMITED EVIDENCE OF CARCINOGENICITY IN HUMANS. NUISANCE DUST TLV = 10 mg/m³. OSHA PEL: CLASSIFIED AS A NUISANCE DUST WHEN LESS THAN 1% CRYSTALLINE SILICA IS PRESENT. IF GREATER THAN 1% CRYSTALLINE SILICA, THEN EXPOSURES SHALL NOT EXCEED AN 8-HOUR TIME-WEIGHTED AVERAGE LIMIT AS STATED IN 29 CFR 1910.1000 TABLE Z-1-A FOR AIR CONTAMINANTS. SPECIFICALLY, SILICA: CRYSTALLINE QUARTZ (RESPIRABLE) 0.1 mg/m³.
IRRITANT TO EYES, NOSE AND LUNGS; PROLONGED INHALATION OF DUST MAY RESULT IN SILICOSIS, A NONCANCEROUS LUNG DISEASE.

EMERGENCY AND FIRST AID PROCEDURES

NO PROCEDURES REQUIRED BEYOND NORMAL PERSONAL HYGIENE - WASH ALL CONTACTED AREAS WITH SOAP AND WATER.
## VI. Reactivity Data

### Conditions Contributing to Instability
- Stable

### Incompatibility
- None

### Hazardous Decomposition Products
- None

### Conditions Contributing to Hazardous Polymerization
- Will not occur

## VII. Spill or Leak Procedures

Steps to be taken if material is released or spilled:
- Normal housekeeping, causes slippery surfaces when wet.

### Neutralizing Chemicals
- NA

### Waste Disposal Method
- Dispose of in accordance with all local, state and federal regulations.

## VIII. Industrial Hygiene Control Measures

### Ventilation Requirements
- Mechanical, general room ventilation.
- Use local ventilation to maintain TLV (See Section V).

### Specific Personal Protective Equipment

#### Respiratory
- If dust concentrations exceed TLV use a NIOSH approved dust respirator

#### Eye
- Goggles

#### Gloves
- Work gloves

#### Other Clothing and Equipment
- Apron, eyewash station
## IX. SPECIAL PRECAUTIONS

### PRECAUTIONARY STATEMENTS

- Avoid prolonged inhalation.
- Recommended labeling:
- Front panel: CAUTION
- See back panel for caution before use.
- Back panel: CAUTION
- This product contains free crystalline silica which according to the IARC has exhibited limited evidence of carcinogenicity in humans. Prolonged inhalation of the powder may result in silicosis, a noncancerous lung disease. Avoid creating dusty conditions and use a NIOSH approved dust respirator.

## OTHER HANDLING AND STORAGE REQUIREMENTS

- Store in a sheltered area or cover for moisture protection.

**ROUTES OF EXPOSURE AND EFFECTS**

This product contains free crystalline silica which according to the IARC has exhibited limited evidence of carcinogenicity in humans. Nuisance dust TLV = 10 mg/m³ OSHA PEL classified as a nuisance dust when less than 1% crystalline silica is present. If greater than 1% crystalline silica, then exposures shall not exceed an 8-hour time-weighted average limit as stated in 29 CFR 1910.1000 Table Z-4.1 for air contaminants, specifically: silica, crystalline quartz (respirable) 0.1 mg/m³.  
Irritant to eyes, nose and lungs; prolonged inhalation of dust may result in lung injury.

**EMERGENCY AND FIRST AID PROCEDURES**

- **FLUSH ALL AREAS CONTACTED WITH RUNNING WATER.** IF IRRITATION PERSISTS, CONTACT PHYSICIAN.  
- **INGESTION:** DRINK WATER. DO NOT INDUCE VOMITING.  
- **INHALATION:** REMOVE TO FRESH AIR. IF BREATHING IS DIFFICULT, GIVE OXYGEN. IF BREATHING HAS STOPPED, GIVE ARTIFICIAL RESPIRATION. GET MEDICAL ATTENTION.

### XI. REGULATORY INFORMATION

#### STATUS ON SUBSTANCE LISTS

Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) requires notification of the National Response Center of releases of hazardous substances equal to or greater than the reportable quantities (RQs) in 40 CFR 302.4.

Components present in this product which may require notification are:

<table>
<thead>
<tr>
<th>Chemical</th>
<th>CAS Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>NONE</td>
<td></td>
</tr>
</tbody>
</table>

Superfund Amendments and Reauthorization Act of 1986 (SARA) Title III requires emergency planning based on threshold planning quantities (TPQs) and release reporting based on RQs.

Components present in this product at a level which could require reporting under the statute are:

| NONE     |            |

SARA requires the submission of annual reports of toxic chemicals that appear in 40 CFR 372 (for SARA 313). This information must be included in all MSDSs that are copied and distributed for this material.

Components present in this product at a level which could require reporting under the statute are:

| NONE     |            |

Toxic Substances Control Act (TSCA)
The ingredients of this product are on the TSCA inventory.

Prepared by: Environmental Services

DATE: July, 1992
LEHIGH PORTLAND CEMENT COMPANY
CORPORATE OFFICE

OSHA 29CFR 1910.1200

January 1991

Material Safety Data Sheet
for
Grout Cements

Section I-Identity

Manufacturer's name and address: Lehigh Portland Cement Company
P.O. Box 1882
Allentown, PA 18105

Emergency Telephone Number: (215) 776-2650

Chemical Name and Synonyms: Grout Cement (CAS # 65997-15-1)
Hydraulic Cement

Trade Name and Synonyms: Lehigh Geocem

Section II-Chemical Data

Chemical family: Calcium Salts

Formula: Grout cement consists of finely ground portland cement clinker and limestone. Portland cement clinker is a sintered material produced by heating to high temperature (greater than 1200 degrees Celsius) a mixture of substances such as limestone and shale from the earth's crust. The substances manufactured are essentially hydraulic calcium silicates contained in a crystalline mass, not separable into the individual components.

Substances similar to the following are known to be present in portland cement:

- $3\text{CaO.SiO}_2$ (CAS # 12168-85-3)
- $2\text{CaO.SiO}_2$ (CAS # 10034-77-2)
- $3\text{CaO.Al}_2\text{O}_3$ (CAS # 12042-78-3)
- $4\text{CaO.Al}_2\text{O}_3\cdot\text{Fe}_2\text{O}_3$ (CAS # 12068-35-8)

Small amounts of CaO, MgO, K$_2$SO$_4$, Na$_2$SO$_4$ may also be present.
Section III-Hazardous Ingredients

Ingredients: Portland cements are listed by OSHA in 29 CFR 1010.1000, Table Z-1-A, and require material safety data sheets (FR, January 19, 1989). MSHA (30 CFR 55.5-1, Ref. 2), ACGIH (TLV's for 1973, Appendix E) and ACGIH (TLV's for 1984-5, Appendix D) list portland cements as nuisance dusts. Portland Cements are NOT listed by NTP, IARC, OR OSHA as carcinogens. However, since portland cement is manufactured from raw materials mined from the earth (limestone, marl, sand, shale, clay, etc.) and process heat is provided by burning fossil fuels, trace, but detectable, amounts of naturally occurring, and possible harmful, elements may be found during chemical analysis. Under ASTM standards, portland cement may contain .75 percent insoluble residue. A fraction of these residues may be free crystalline silica.

California & New Jersey Residents see attachment

Section IV-Physical Data

Boiling Point: Not applicable, grout cement is a powdered solid.
Vapor Pressure: Not applicable, grout cement is a powdered solid.
Vapor Density: Not applicable, grout cement is a powdered solid.
Solubility in Water: Slight (0.1-1.0%) Specific Gravity: (H2O=1) 2.88
Evaporation Rate: Not applicable, grout cement is a powdered solid.
Appearance and Odor: Gray powder; no odor.
Melting Point: Not applicable.

Section V-Fire and Explosion Hazard Data

Flash Point: Grout cement is noncombustible and not explosive.
Flammable or Explosive Limits: Not applicable.
Extinguishing Media: Not applicable.
Special Firefighting Procedures: Not applicable.
Unusual Fire and Explosion Hazards: None.
Lower Explosive Limit: Not applicable.
Upper Explosive Limit: Not applicable.
Section VI—Health Hazard Data

ACGIH Threshold Limit Value (1988-89): Total dust containing no asbestos and less than 1% silica - 10 mg/m³

OSHA PEL (Transitional): Total dust - 30 million particles/ft³

OSHA PEL (Final): Total dust - 10 mg/m³
   Respirable dust - 5 mg/m³

Effects of Overexposure:

Acute: Grout cement when dry is non-hazardous. When in contact with moisture (such as in eyes or on skin) or when mixed with water to make concrete, mortar, or grout it becomes highly caustic and will burn (as severely as third-degree) the eyes or skin. Inhalation of dry portland cement can irritate the upper respiratory system.

Chronic: Cement dust can cause inflammation of the lining tissue of the interior of the nose and inflammation of the cornea. Hypersensitive individuals may develop an allergic dermatitis. (Cement may contain trace (less than 0.05%) amounts of chromium salts or compounds including hexavalent chromium, or other metals found to be hazardous or toxic in some chemical forms. These metals are mostly present as trace substitutions within the principal minerals.)

Emergency and First Aid Procedures: Flush eyes immediately and repeatedly with water and seek prompt medical attention. Wash exposed skin areas with soap and water. If irritation or inflammation occurs seek prompt medical attention.

Section VII—Reactivity Data

Stability: Product is stable. Keep dry until used.

Incompatibility: Aluminum powder and other alkali and alkaline earth elements will react in wet mortar or concrete, liberating hydrogen gas.

Hazardous Decomposition Products: None

Hazardous Polymerization: Will not occur.

Section VIII—Spill Procedures

Steps to be taken in case material is spilled: Use dry cleanup methods that do not disperse the dust into the air. Avoid breathing the dust. Emergency procedures are not required.
Disposal Method: Small amounts of material can be disposed of as common waste or returned to the container for later use if not contaminated. Large volumes may require special handling.

Section IX-Special Protection Information

Respiratory Protection: Use a MSHA/NIOSH approved respirator in dusty environments.

Ventilation: Local exhaust can be used to control airborne dust levels.

Eye Protection: Use tight fitting goggles in dusty environments, or when working in concrete construction.

Skin Protection: Use barrier creams, impervious, abrasion- and alkali-resistant gloves, boots and protective clothing to protect the skin from prolonged contact with wet cement in plastic concrete, mortar or slurries. Immediately after working with cement or cement-containing materials, workers should shower with soap and water. Precautions must be taken. A cement burn occurs with very little warning as little heat is sensed by the skin.

SECTION V - HEALTH HAZARD DATA

CALIFORNIA PROPOSITION 65:
PRODUCT OR PRODUCT COMPONENTS ARE REGULATED UNDER CALIF. PROPOSITION 65.
CARCINOGENIC DETERMINATION:
PRODUCT OR COMPONENTS ARE LISTED AS A POTENTIAL CARCINOGEN ACCORDING TO: IARC

PRODUCT TOXICITY DATA: NOT DETERMINED

PRODUCT TLV: 10 MG/M3(T) 5 MM/M3(R)

------------------------------- EFFECTS OF EXPOSURE ------------------------------

ROUTES OF EXPOSURE:
EYE OR SKIN CONTACT. INHALATION.
EYE:
DUST MAY CAUSE MODERATE TO SEVERE EYE IRRITATION WITH CORNEAL INJURY THAT MAY BE SLOW TO HEAL.
SKIN:
CEMENT DUST CAN BE IRRITATING TO SKIN. WET CEMENT CAN DRY THE SKIN AND CAUSE ALKALI BURNS. SENSITIVE INDIVIDUALS MAY DEVELOP ALLERGIC DERMATITIS.
INHALATION:
MAY BE IRRITATING.
TREAT AS NUISANCE DUST.
INGESTION:
NO DATA AVAILABLE

CHRONIC EFFECTS:
CRYSTALLINE SILICA IS NOT ON THE NTP OR OSHA CARCINOGEN LIST. IARC HAS DETERMINED THERE IS SUFFICIENT EVIDENCE FOR CARCINOGENICITY OF CRYSTALLINE SILICA TO EXPERIMENTAL ANIMALS AND LIMITED EVIDENCE TO HUMANS. "LIMITED EVIDENCE" MEANS POSSIBLE RELATIONSHIP, BUT OTHER FACTORS CANNOT BE EXCLUDED. CONTAINS TRACE AMOUNTS OF ARSENIC. A CHEMICAL KNOWN TO THE STATE OF CALIFORNIA TO CAUSE CANCER. EXPOSURE TO ARSENIC SHOULD NOT EXCEED THE FEDERAL OSHA PEL UNLESS USED IN A MANNER THAT PRODUCES EXTREMELY HEAVY AIRBORNE CONCENTRATIONS OF PRODUCT AT LEVELS WELL ABOVE THE ALLOWABLE LIMITS.

SOMATIC SYMPTOMS AFFECTED:
BECAUSE OF ITS IRRITATING PROPERTIES, THIS MATERIAL MAY AGGRAVATE AN EXISTING DERMATITIS.

------------------------------- EMERGENCY AND FIRST AID PROCEDURES ------------------------------

EYE:
IMMEDIATELY FLUSH EYES WITH PLENTY OF WATER FOR AT LEAST 15 MINUTES. IF IRRITATION PERSISTS. SEEK PROMPT MEDICAL ATTENTION.
SKIN:
PROMPTLY WASH SKIN WITH SOAP AND WATER. WASH CLOTHING BEFORE REUSE.
INHALATION:
REMOVE TO FRESH AIR. IF IRRITATION PERSISTS. SEEK MEDICAL ATTENTION.
INGESTION:
DO NOT INDUCE VOMITING! IN GENERAL. NO TREATMENT IS NECESSARY UNLESS LARGE QUANTITIES ARE INGESTED. HOWEVER. MEDICAL ADVICE SHOULD BE OBTAINED.

* * * * * * * SECTION VI - REACTIVITY DATA - * * * * * * * * *

STABILITY: STABLE
CONDITIONS TO AVOID:
STORE IN A DRY LOCATION.
INCOMPATIBILITY (MATERIALS TO AVOID):
NONE KNOWN.
HAZARD POLYMERIZATION: WON'T OCCUR
CONDITIONS TO AVOID:
NOT APPLICABLE.

* * * * * * * SECTION VII - SPILL OR LEAK PROCEDURES - * * * * * * *

STEPS TO BE TAKEN IF MATERIAL IS RELEASED OR SPILLED:
- USE PROTECTIVE EQUIPMENT. SWEEP UP AND REMOVE. AVOID CREATING OR INHALING DUST.
WASTE DISPOSAL METHOD:
IF NOT CONTAMINATED. REUSE PRODUCT.
GET APPROVAL FROM LANDFILL OPERATOR AND TRANSPORT TO SANITARY LANDFILL.

SECTION VIII - SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION (USE NIOSH/MSHA APPROVED EQUIPMENT):

TOXIC DUST/MIST RESPIRATOR.

VENTILATION:
USE ONLY WITH ADEQUATE VENTILATION.

PROTECTIVE GLOVES:
NORMAL WORK GLOVES.

EYE PROTECTION:
DUST PROOF GOGGLES.

OTHER PROTECTIVE EQUIPMENT:
NORMAL WORK COVERALLS.

SECTION IX - SPECIAL PRECAUTIONS

PRECAUTIONARY LABELING CEMENT. MICRO MATRIX CEMENT. 2500 LBS. 516.006120

WARNING:
CONTAINS A SMALL AMOUNT OF CRYSTALLINE SILICA. REPEATED OR PROLONGED INHALATION OF DUST MAY CAUSE A DELAYED RESPIRATORY ILLNESS (SILICOSIS). THE INTERNATIONAL AGENCY FOR RESEARCH ON CANCER (IARC) HAS DETERMINED THERE IS LIMITED EVIDENCE OF THE CARCINOGENICITY OF CRYSTALLINE SILICA.

MAY CAUSE EYE AND SKIN IRRITATION.

MAY CAUSE SKIN BURNS IF CEMENT IS WET OR WITH CONFINE INTIMATE CONTACT.

FOR PRECAUTIONARY STATEMENTS, REFER TO SECTIONS IV-VIII.

OTHER HANDLING AND STORAGE CONDITIONS:
STORE IN DRY LOCATION TO PROTECT PRODUCT QUALITY.
AVOID CREATING OR INHALING DUST.
AVOID CONTACT WITH SKIN. EYES AND CLOTHING.

CONTAINER DISPOSITION:
EMPTY CONTAINER COMPLETELY. DISPOSE OF EMPTY CONTAINER IN SANITARY LANDFILL BY FIRST OBTAINING LANDFILL OPERATOR'S AUTHORIZATION.

SECTION III - PHYSICAL DATA (Continued)

Flash Point: N/A

Fire Extinguishing Media
Use extinguishing media appropriate for surrounding fire.

Special Fire-Fighting Procedures
Firefighters should wear proper protective equipment and self-contained breathing apparatus with full facepiece operated in positive pressure mode.

Toxic Gases Produced
hydrogen chloride

SECTION IV - HEALTH HAZARD DATA

Toxicity: 
LD₅₀ (oral-rat)(mg/kg) - 1000
LD₅₀ (ipr-mouse)(mg/kg) - 280

Effects of Overexposure
Contact with skin or eyes may cause severe irritation or burns. Ingestion may cause nausea and vomiting. Dust may irritate nose and throat.

SECTION V - REACTIVITY DATA

Stability: Stable
Hazardous Polymerization: Will not occur

Conditions to Avoid: moisture
Incompatibles: most common metals, water

Decomposition Products: hydrogen chloride

SECTION VI - SPILL AND DISPOSAL PROCEDURES

Steps to be taken in the event of a spill or discharge
Wear self-contained breathing apparatus and full protective clothing. With clean shovel, carefully place material into clean, dry container and cover; remove from area. Flush spill area with water.

Disposal Procedure
Dispose in accordance with all applicable federal, state, and local environmental regulations.

Continued on Page: 3
Calcium Chloride, Anhydrous

Effective: 09/26/85
Issued: 09/26/85

SECTION III - INDUSTRIAL PROTECTIVE EQUIPMENT

Ventilation: Use adequate general or local exhaust ventilation to keep fumes and dust levels as low as possible.

Respiratory Protection: None required where adequate ventilation conditions exist. If airborne concentration is high, use an appropriate respirator or dust mask.

Eye/Skin Protection: Safety glasses with sideshields, uniform, rubber gloves are recommended.

SAF-T-DATA\textsuperscript{TM} Storage Color Code: Orange

Special Precautions
Keep container tightly closed. Suitable for any general chemical storage area.

SECTION IX - STORAGE AND HANDLING PRECAUTIONS

DOMESTIC (D.O.T.)

Product Codes: 1313

PRECAUTIONARY LABELLING

BAKER SAF-T-DATA™ System

Laboratory Protective Equipment

STORAGE: Keep in tightly closed container.

SECTION II - HAZARDOUS COMPONENTS

Calcium Chloride 90-100 10043-52-4

SECTION III - PHYSICAL DATA

Boiling Point: N/A
Melting Point: 772°C (1422°F)
Specific Gravity: 2.15

Solubility(H₂O): Complete (in all proportions) % Volatiles by Volume: 0

Continued on Page: 2
SECTION III - PHYSICAL DATA (Continued)

Appearance & Odor: White pellets.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

Flash Point: N/A

Fire Extinguishing Media
Use extinguishing media appropriate for surrounding fire.

Special Fire-Fighting Procedures
Firefighters should wear proper protective equipment and self-contained breathing apparatus with full facepiece operated in positive pressure mode.

Toxic Gases Produced
hydrogen chloride

SECTION V - HEALTH HAZARD DATA

Toxicity:
LD₅₀ (oral-rat)(mg/kg) - 1000
LD₅₀ (ipr-mouse)(mg/kg) - 280

Effects of Overexposure
Contact with skin or eyes may cause severe irritation or burns. Ingestion may cause nausea and vomiting. Dust may irritate nose and throat.

SECTION VI - REACTIVITY DATA
Stability: Stable
Hazardous Polymerization: Will not occur

Conditions to Avoid: moisture

Incompatibles: most common metals, water

Decomposition Products: hydrogen chloride

SECTION VII - SPILL AND DISPOSAL PROCEDURES

Steps to be taken in the event of a spill or discharge
Wear self-contained breathing apparatus and full protective clothing. With clean shovel, carefully place material into clean, dry container and cover; remove from area. Flush spill area with water.

Disposal Procedure
Dispose in accordance with all applicable federal, state, and local environmental regulations.

Continued on Page: 3
Calcium Chloride, Pellets

SECTION VIII - INDUSTRIAL PROTECTIVE EQUIPMENT

Ventilation: Use adequate general or local exhaust ventilation to keep fume or dust levels as low as possible.

Respiratory Protection: None required where adequate ventilation conditions exist. If airborne concentration is high, use an appropriate respirator or dust mask.

Eye/Skin Protection: Safety glasses with sideshields, uniform, rubber gloves are recommended.

SECTION IX - STORAGE AND HANDLING PRECAUTIONS

SAF-T-DATA™ Storage Color Code: Orange

Special Precautions

Keep container tightly closed. Suitable for any general chemical storage area.

SECTION X - TRANSPORTATION DATA AND ADDITIONAL INFORMATION

DOMESTIC (D.O.T.)

Proper Shipping Name Chemicals, n.o.s.

INTERNATIONAL (I.M.O.)

Proper Shipping Name Chemicals, n.o.s.

CUST#: 580031

NAME: CALCIUM SILICATE, -200 MESH, 99%

PRODUCT #: 37266-8
CAS #: 1344-95-2
MF: CAO3Si

---------- HEALTH HAZARD DATA ----------

IF INHALED: REMOVE TO FRESH AIR. IF NOT BREATHING GIVE ARTIFICIAL RESPIRATION. IF BREATHING IS DIFFICULT, GIVE OXYGEN. IF SWALLOWED, WASH OUT MOUTH WITH WATER PROVIDED PERSON IS CONSCIOUS. CALL A PHYSICIAN. WASH CONTAMINATED CLOTHING BEFORE REUSE.

---------- PHYSICAL DATA ----------

SPECIFIC GRAVITY: 2.900
APPEARANCE AND ODOR: WHITE POWDER

---------- FIRE AND EXPLOSION HAZARD DATA ----------

EXTINGUISHING MEDIA: WATER SPRAY, CARBON DIOXIDE, DRY CHEMICAL POWDER OR APPROPRIATE FOAM.
SPECIAL FIREFIGHTING PROCEDURES: WEAR SELF-CONTAINED BREATHING APPARATUS AND PROTECTIVE CLOTHING TO PREVENT CONTACT WITH SKIN AND EYES.
UNUSUAL FIRE AND EXPLOSIONS HAZARDS: EMITS TOXIC FUMES UNDER FIRE CONDITIONS.

---------- REACTIVITY DATA ----------

INCOMPATIBILITIES: STRONG OXIDIZING AGENTS
HAZARDOUS COMBUSTION OR DECOMPOSITION PRODUCTS: TOXIC FUMES OF: SILICON DIOXIDE

---------- SPILL OR LEAK PROCEDURES ----------

STEPS TO BE TAKEN IF MATERIAL IS RELEASED OR SPILLED: WEAR RESPIRATOR, CHEMICAL SAFETY GOGGLES, RUBBER BOOTS AND HEAVY RUBBER GLOVES.
Sweep up, place in a bag and hold for waste disposal.

CONTINUED ON NEXT PAGE
PRODUCT #: 37266-8  NAME: CALCIUM SILICATE, -200 MESH, 99%
CAS #: 1344-05-2  MF: CA3Si

------------- SPILL OR LEAK PROCEDURES -------------
AVOID RAISING DUST.
VENTILATE AREA AND WASH SPILL SITE AFTER MATERIAL PICKUP IS COMPLETE.
WASTE DISPOSAL METHOD
DISSOLVE OR MIX THE MATERIAL WITH A COMBUSTIBLE SOLV'NT AND BURN IN A
CHEMICAL INCINERATOR EQUIPPED WITH AN AFTERBURNER AND SCRUBBER.

--- PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE ---
CHEMICAL SAFETY GOGGLES.
COMPATIBLE CHEMICAL-RESISTANT GLOVES.
NIOSH/MSHA-APPROVED RESPIRATOR.
SAFETY SHOWER AND EYE BATH.
MECHANICAL EXHAUST REQUIRED.
DO NOT BREATHE DUST.
AVOID CONTACT WITH EYES, SKIN AND CLOTHING.
WASH THOROUGHLY AFTER HANDLING.
IRRITATING DUST.
KEEP TIGHTLY CLOSED.
STORF IN A COOL DRY PLACE.
LABEL PRECAUTIONARY STATEMENTS
IRRITANT.
IRRITATING TO EYES AND RESPIRATORY SYSTEM.
IRRITATING DUST.
IN CASE OF CONTACT WITH EYES, RINSE IMMEDIATELY WITH PLENTY OF
WATER AND SEEK MEDICAL ADVICE.
DO NOT BREATHE DUST.
WEAR SUITABLE GLOVES AND EYE/FACE PROTECTION.

SECTION I - PRODUCT IDENTIFICATION

Product Name: Sodium meta-Silicate, 9-Hydrate, Crystal
Formula: \( \text{Na}_2\text{SiO}_3 \cdot 9\text{H}_2\text{O} \)
Formula Ut: 284.20
CAS No.: 90-100-6834-92-0
Product Codes: 3868

SECTION II - HAZARDOUS COMPONENTS

Component

Sodium meta-Silicate, 9-Hydrate 90-100 6834-92-0

Boiling Point: N/A
Melting Point: N/A
Specific Gravity: 0.00

SECTION III - PHYSICAL DATA

Vapor Pressure (mmHg): N/A
Vapor Density (air=1): N/A
Evaporation Rate: N/A
(Butyl Acetate=1)

Continued on Page: 2
S4970 -01 Sodium meta-Silicate, 9-Hydrate, Crystal

SECTION III - PHYSICAL DATA (Continued)

Solubility(H₂O): Appreciable (more than 10 %) % Volatiles by Volume: 0

Appearance & Odor: White platelets.

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

Flash Point: N/A

Fire Extinguishing Media:
Use extinguishing media appropriate for surrounding fire.

SECTION V - HEALTH HAZARD DATA

Effects of Overexposure:
Ingestion may cause gastrointestinal pain.

Emergency and First Aid Procedures:
In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Flush skin with water.

SECTION VI - REACTIVITY DATA

Stability: Stable
Hazardous Polymerization: Will not occur

Conditions to Avoid: none documented

Incompatibilities: fluorine

SECTION VII - SPILL AND DISPOSAL PROCEDURES

Steps to be taken in the event of a spill or discharge:
Wear self-contained breathing apparatus and full protective clothing. With clean shovel, carefully place material into clean, dry container and cover; remove from area. Flush spill area with water.

Disposal Procedure:
Dispose in accordance with all applicable federal, state, and local environmental regulations.

Ventilation:
Use adequate general or local exhaust ventilation to keep fume and dust levels as low as possible.

Respiratory Protection:
None required where adequate ventilation conditions exist. If airborne concentration is...
SECTION VIII - INDUSTRIAL PROTECTIVE EQUIPMENT (Continued)

High, use an appropriate respirator or dust mask.

Eye/Skin Protection: Safety glasses with sideshields, uniform, proper gloves are recommended.

SECTION IX - STORAGE AND HANDLING PRECAUTIONS

SAF-T-DATA TM Storage Color Code: Orange

Special Precautions
Keep container tightly closed. Suitable for any general chemical storage area.

Sodium Silicate Solution

SECTION I - PRODUCT IDENTIFICATION

Product Name: Sodium Silicate Solution
Formula: \( \text{Na}_2\text{O} \cdot \text{SiO}_2 \cdot y \text{H}_2\text{O} \)
Formula Wt: 134
CAS No.: 98-38-0
Common Synonyms: Water Glass; Soluble Glass; Silicate of Soda
Product Code: 5135, 3877

PRECAUTIONARY LABELLING

Laboratory Protective Equipment

Precautionary Label Statements

WARNING!
CAUSES IRRITATION
Avoid contact with eyes, skin, clothing.
Keep in tightly closed container. Wash thoroughly after handling.

SECTION II - HAZARDOUS COMPONENTS

Component | % | CAS No.
--- | --- | ---
Sodium Silicate | 35-40 | 98-38-0

SECTION III - PHYSICAL DATA

Boiling Point: 102°C (216°F)
Melting Point: N/A
Specific Gravity: 1.38

Vapor Pressure(mmHg): 18
Vapor Density(air=1): N/A
Evaporation Rate: N/A

Continued on Page: 2
SECTION III - PHYSICAL DATA (Continued)

Solubility (H₂O): Complete (in all proportions) % Volatiles by Volume: 70-80

Appearance & Odor: Colorless, turbid liquid with no odor or slightly soapy odor

SECTION IV - FIRE AND EXPLOSION HAZARD DATA

Flash Point: N/A

Fire Extinguishing Media
Use extinguishing media appropriate for surrounding fire.

SECTION V - HEALTH HAZARD DATA

Effects of Overexposure
Contact with skin or eyes may cause irritation.

Emergency and First Aid Procedures
In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Flush skin with water.

Stability: Stable
Hazardous Polymerization: Will not occur

Incompatibles: mineral acids, organic acids, most common metals, organic materials

SECTION VII - SPILL AND DISPOSAL PROCEDURES

Steps to be taken in the event of a spill or discharge
Wear suitable protective clothing. Take up with sand or other noncombustible absorbent material and place into container for later disposal. Flush spill area with water.

Disposal Procedure
Dispose in accordance with all applicable federal, state, and local environmental regulations.

SECTION VIII - INDUSTRIAL PROTECTIVE EQUIPMENT

Ventilation: Use adequate general or local exhaust ventilation to keep vapor and mist levels as low as possible.

Respiratory Protection: None required where adequate ventilation conditions exist. If airborne concentration is high, use an appropriate respirator or dust mask.

Continued on Page: 3
Sodium Silicate Solution

Effective: 10/24/85
Issued: 10/25/85

SECTION VIII - INDUSTRIAL PROTECTIVE EQUIPMENT (Continued)

Eye/Skin Protection: Safety goggles, uniform, apron, rubber gloves are recommended.

SECTION IX - STORAGE AND HANDLING PRECAUTIONS

Saf-T-DATA™ Storage Color Code: Orange

Special Precautions
Keep container tightly closed. Suitable for any general chemical storage area.

SECTION X - TRANSPORTATION DATA AND ADDITIONAL INFORMATION

DOMESTIC (D.O.T.)
Proper Shipping Name Chemicals, n.o.s.

INTERNATIONAL (I.M.O.)
Proper Shipping Name Chemicals, n.o.s.

N/A = Not Applicable or Not Available

The information published in this Material Safety Data Sheet has been compiled from our experience and data presented in various technical publications. It is the user's responsibility to determine the suitability of this information for the adoption of necessary safety precautions. We reserve the right to revise Material Safety Data Sheets periodically as new information becomes available.
SECTION I. CHEMICAL AND PHYSICAL PROPERTIES

BALANCE DECORPOSITION PRODUCTS: Oxides of Carbon and Nitrogen.

TOXIC AND HAZARDOUS INGREDIENTS:

Flash: Liquid

Appearance: Viscous Liquid

SPECIFIC GRAVITY: 1.006

VAPOR PRESSURE: < 0.001

Flash Point: 200°F, 93°C

SECTION II. FIRE AND EXPLOSION DATA

SPECIAL FIRE FIGHTING PROCEDURES: Firefighters must be equipped to prevent breathing of vapors or products of combustion. Must wear self-contained breathing apparatus.

UNUSUAL FIRE AND EXPLOSION HAZARDS: Avoid moisture contamination in closed containers. Reaction with moisture will generate CO2 which may engulf the container.

FLASH POINT: (UNTESTED N.E.C.) HID

EXTINCTION DEPTH: Dry chemical, CO2, water spray, foam.

SECTION IV. HEALTH HAZARD DATA

PERMISSIBLE CONCENTRATION: Airborne Hexylene Diglycol Isocyanate (HDI) OSHA PEL: 0.02 (ppm)

EFFECTS OF SAFETY: Irritant to skin and respiratory tract. May cause headache, nausea, vomiting, shortness of breath, chest pain. May result in respiratory distress.

TOXICITY PROPERTIES: May cause allergic skin or respiratory reaction.

Persons with known respiratory allergies should avoid exposure to this product.

EMERGENCY FIRST AID PROCEDURES:

Eye: Flush with plenty of water for at least 15 minutes. Call a physician.

Skin: Wash thoroughly with soap and water; remove contaminated clothing and discard contaminated shoes. Wash clothing before reuse.

IMMEDIATE:

Remove from contaminated area to a fresh air supply. Call a physician. Victim is not breathing, give artificial respiration. If breathing is difficult, give oxygen.

If Swallowed: Call a physician immediately.

SECTION V. SPECIAL PROTECTION INFORMATION

VENTILATION TYPE REQUIRED: Mechanical general/local exhaust ventilation control at proper rates as stated by National Safety Institute.

PERSONAL PROTECTION: Not only NIOSH approved apparatus.

PROTECTIVE GLOVES: No protective rubber or plastic.

EYE PROTECTION: No safety glasses and face shield to prevent splashing of face.

SECTION VI. HANDLING OF SPILLS OR LEAKS

PROCEDURES FOR CLEAN-UP: With adequate ventilation, cover with an inert absorbent material such as clay or vermiculite, transfer to metal container. Secure with water but do not seal the container. CO2 is not generated. Wash the area with water containing 5% ammonia and detergents. Never respirator and other protective equipment for protection of eyes and skin during clean-up.

NICE REGULATIONS/AS/NZS/CE: It is not responsible for disposing of containers. User must dispose of container with Federal, State, and local regulations.

SECTION VII. SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE: Avoid contact with moisture. Contamination by moisture or water may cause material to re- and generate C02 which will require sealed containers. Store between 85 degrees F. (16 and 20 degrees C) and 95 degrees F. (35 and 32 degrees C) in a dry, well ventilated area with a complete vapor barrier. If exposed, wash with soap and water. If skin is exposed, wash with soap and water. If contact is made, wash with soap and water. If inhaled, remove to fresh air. If irritation persists, call a physician.

SECTION VIII. TRANSPORTATION DATA

UN/ENDS: 4.3 DATA: D.O.T.

SDS-O.P. 1 - 5.6 MSDS-O.P. 1 - 5.6

PACKING GROUP: III

LOCATION OF SHIPMENTS: Liquid Plastic Material-Non Explosive

TRANSPORTATION EMERGENCY INFORMATION: 01000-4104-500

SECTION IX. PRECAUTIONARY STATEMENTS FOR PACKED PRODUCTS IS AN ORGANIC HAZARD AND MUST BE CONSIDERED AS CONTAINABLE. THE PACK MUST BE RETAINED IN A LEAK-TIGHT BODY FREE OF IMPURITIES. SEALS THE PACK AGAINST THE TRANSPORTATION MARCH.

GREEN MOUNTAIN, INC. IS A MANUFACTURING AGENT. ALL INFORMATION IS GREEN MOUNTAIN, INC. CHINS DIRECTLY FROM THE CHEMICAL MANUFACTURERS TO SUPPLY CHEMICAL MOUNTAIN WITH PRODUCT. THE USED MUST INTEGRATE THE ACCURACY AND COMPLETE OF SUCH INFORMATION AND THE APPROPRIATENESS OF THE MATERIAL FOR THE GREEN APPLICATION. IN RELIGIOUS THE STATEMENTS, TECHNICAL INFORMATION AND RECOMMENDATIONS CONTAINED HEREIN ARE RELIABLE, BUT THEY ARE GIVEN WITHOUT WARRANTY OR GUARANTEE OF ANY KIND. EXPRESS OR IMPLIED, AND WE ASSUME NO LIABILITY FOR ANY LOSS, DAMAGE, OR EXPENSE RESULTING FROM THEM USE.
MATERIAL SAFETY DATA SHEET - "B" SIDE

(CATALYSTS packed in posts or 1-gallon cans)

MANUFACTURER/DISTRIBUTOR:
GREAT HOMESTYLE, INC.

HARRISON, ILLINOIS 60421

CHEMICAL NAME/LABEL:
BLEACHING GROUT (polyurethane)

SECTION II CHEMICAL AND PHYSICAL PROPERTIES

REACTION AND DECOMPOSITION PROPERTIES:
Onset of Carbon and Nitrogen.

INCOMPATIBILITY (SEPARATE FROM) Sources with incompatible

POISON AND HAZARDOUS SUBSTANCES:
Anise Catalyst (00%)

PH OF LIQUID:
4.00-4.50

APPEARANCE:
Viscous Liquid

COLOR:
Gray

SPECIFIC GRAVITY:
> 1.45 at 25 C

REACTIVITY:
Not Explosive

RELATIVITY IN WATER:
Small at 25 C & VOLATILE (35 RPM) 50 C.

VAPOR PRESSURE:
Not specified (0.3 or 24 C).

FIRE AND EXPLOSION DATA

FIRE FIGHTING PROBLEMS:
Fire fighters must be equipped to prevent breathing of vapors or products of combustion. Must wear self-contained breathing apparatus.

GENERAL FIRE AND EXPLOSION HAZARDS:
N/A

FLAMABILITY LIMITS:
Not applicable

STABILITY:
Stable

REACTIVITY AT 30 F:
Not specified

SECTION III FIRE AND EXPLOSION DATA

POTENTIAL FIRE FIGHTING AID:
N/A

POSSIBLE EXTINGUISHING AGENTS:
Dry chemical, CO2, water spray, foam.

SECTION IV HEALTH HAZARD DATA

POSSIBLE EXPOSURE ALARMS:
N/A

OBTAINABLE PHYSICAL PROPERTIES:
N/A

IMMEDIATE FIRST AID PROCEDURES:
Skin:
Flush with plenty of water for at least 15 minutes. Call a physician.

Eyes:
Flush thoroughly with soap and water. Remove contaminated clothing and discard contaminated shoes. Seek medical attention immediately.

Inhalation:
Remove from contaminated area to a fresh air supply. Call a physician. If victim is not breathing, give artificial respiration. If breathing is difficult, give oxygen.

If Swallowed:
Call a physician immediately.

SECTION V SPECIAL PROTECTION INFORMATION

VENTILATION TYPE REQUIRED:
Mechanical general/local exhaust ventilation control vapor or dust below maximum exposure limits.

RESPIRATORY PROTECTION:
Use only listed approved apparatus.

PERSONAL PROTECTIVE EYE WEAR:
Lenses impervious to plastic.

PPE PROTECTION:
Use safety goggles and face shield to avoid splashing in face.

SECTION VI HANDLING OF SPILLS OR LEAKS

PROCEDURES FOR CLEAN-UP:
With adequate ventilation, cover with an inert absorbent material such as clay or vermiculite, transfer to a waste container. Wash the area with water and detergent. Wear protective equipment for protection of eyes and also during clean-up.

WASTE DISPOSAL:
Distributor/Manufacturer is not responsible for disposal containers. Buyer must dispose of containers consistent with Federal, State and local regulations.

SECTION VII SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORAGE:
Store between 40 and 60 degrees F. (16 and 36 degrees C).

SECTION VIII TRANSPORTATION DATA

UN/CLASS #: 0000

PROPER SHIPPING NAME: BLEACHING GROUT

P.L.D.T.: POISON

D.O.T. NO.: None

LABEL REQUIREMENTS:
None for domestic transportation.

FREIGHT CLASSIFICATION:
Basis of Group Class 8 55 Item No. 444

TRANSPORTATION HAZARD INFORMATION:
CME: 31 (1-4-81-300)

SECTION IX PRECAUTIONARY STATEMENTS:
- THE FOAM PRODUCED IS AN ORGANIC MATERIAL AND MUST BE CONSIDERED AS COMBUSTIBLE. THE FOAM MUST NOT BE EXPOSED OR IMPREGNATED. SHIELD THE FOAM FROM HAY OR SPIKES WITH A FIRE BARRIER.

DIVISION DATE: 04/04/04

GREAT HOMESTYLE, INC. IS A MARKETING AGENCY. ANY AND ALL DATA PROVIDED BY GREAT HOMESTYLE, INC. COMES DIRECTLY FROM THE CHEMICAL MANUFACTURER; THE GREAT HOMESTYLE, INC. WE BELIEVE THE STATEMENTS, TECHNICAL INFORMATION AND RECOMMENDATIONS CONTAINED HEREIN TO BE RELIABLE, BUT THEY ARE GIVEN WITHOUT WARRANTY OR GUARANTEE OF ANY KIND, EXPRESS OR IMPLIED. AND WE ALMOST BE RESPONSIBLE FOR ANY LOSS, DAMAGE, OR EXPENSE DIRECT OR CONSEQUENTIAL, ARISING FROM THEIR USE.
POTABLE WATER COMPATIBILITY AND THE EPA

H.H. HOLMES TESTING LABORATORIES, INC.

Report No. 1 • 170 Shepard Avenue • Wheeling, Illinois 60090 • Area Code 312 - 541-404(1

October 3, 1990

Green Mountain, Inc.
4 N 250 Rte. 53
Addison, IL 60101

Dear Sirs:

At your request a sample of Mountain Grout® (Regular) was molded and placed in a distilled water bath for twenty-eight (28) days. There was no leaking of any chemical in the distilled water at the end of seven or twenty-eight days.

We feel that the Mountain Grout® that is used to repair and waterproof the concrete structure is not harmful to potable water.

Hoping to have been of service, we remain,

Respectfully submitted,

Richard E. Nelson, Jr.
President

ENVIRONMENTAL PROTECTION AGENCY NOTICE

NOTE: As of July 7, 1988, the EPA no longer approves or disapproves the effects of substances which come into contact with potable water. See the "Federal Register" of that date entitled "Part IV Environmental Protection Agency, drinking water technical assistance: termination of the federal drinking water additives program notice".

SECTION V - HEALTH HAZARD DATA

IDENTITY OF SUBSTANCE: Not established

HAP FRACTION: Liquid: Irritating to skin and eyes

Vapor: Irritating to eyes and lungs

EMERGENCY AND FIRST AID PROCEDURES:

Eye contact: Immediately flush with plenty of water, obtain medical care.
Skin contact: Wash with soap and water.
Inhalation: Provide fresh air, discard contaminated clothing.

SECTION VI - REACTIVITY DATA

Stability: STABLE

HAZARD COMPLIANCE INFORMATION:

HAZARDOUS COMPOSITION:

HARMFUL DECOMPOSITION PRODUCTS:

HAZARDOUS POLYMERIZATION:

SECTION VII - SPILL OR LEAK PROCEDURES

Spills to be absorbed in absorbent earth, the absorbent can be swept up and transferred to an open drum filled with water and allowed to stand in a ventilated location for 48 hours.

Decontaminated waste is harmless and should be disposed according to local regulations.

SECTION VIII - SPECIAL PROTECTION INFORMATION

PERSONAL PROTECTION EQUIPMENT:

NOTE: Use only with adequate ventilation, avoid eye contact, avoid prolonged breathing of vapor and prolonged or repeated skin contact.

SECTION IX - SPECIAL PRECAUTIONS

Keep container closed when not in use.

Mr. Bert Kriekemans  
General Manager  
De Neef America Incorporated  
122 North Mill Street  
St. Louis, Michigan 48880-0034  

RE: File Number 07-002.00AE683  

Dear Mr. Kriekemans:

Based on information submitted, the product listed below is acceptable for use as a coating for potable water applications when used within the conditions stated below:

Product:  TACSS Chemical Grout

Conditions:  
1. The product is properly applied according to the manufacturer's specifications.
2. The percentage of total surface covered is less than 10% of the area contacting the water.
3. The product continues to meet the specifications of good manufacturing practices.
4. After complete curing, the repaired surface is thoroughly rinsed with potable water prior to being placed in service.

We would not anticipate any adverse health effects resulting from such use of this product assuming the product continues to meet the supplied specifications.

We are currently in the process of revising our evaluation procedures as outlined in the Federal Register, Vol. 44, No. 141, 43775-8, July 20, 1979. When these revisions are completed and the interim procedures are in place, all existing advisories will be periodically reviewed.
Our opinion concerning the safety of the product does not constitute an endorsement, nor does it relate to its effectiveness for the intended use. If this letter is to be used in any way, we require that it be quoted in its entirety.

Sincerely yours,

[Signature]

4. REACTIVITY DATA

STABILITY: Stable

INCOMPATIBILITY - MATERIALS TO AVOID:
Reacts with moisture. Therefore, water and moisture must be avoided
prior to use.

HAZARDOUS POLYMERIZATION: Will Not Occur

HAZARDOUS DECOMPOSITION PRODUCTS:
Carbon monoxide, carbon dioxide and nitrogen decomposition products
including the possibility of hydrogen cyanide.

5. ENVIRONMENTAL INFORMATION

SPILL RESPONSE:
Observe precautionary information in all sections. Prevent material
from entering drains; use diking or cover floor drains if necessary.
If material enters drain, flush with large amounts of water. Cover
spill with an absorbent material. Collect in open-head drum or pail,
stir in an estimated equal amount of water and let sit 1/2-hour.

RECOMMENDED DISPOSAL:
If waste is fully cured (by mixing with sufficient water), the gel
could be buried in a sanitary landfill. Uncured liquid waste should
be disposed of by chemical incineration or at a disposal facility
capable of handling flammable wastes. Wastes should be disposed in
accordance with local and state regulations. Uncured liquid waste
material is designed as D082 (flammable waste) by USEPA RCRA
Standards (40CFR Part 261.21).

ENVIRONMENTAL DATA:
N/D

SARA HAZARD CLASS:
FIRE HAZARD: Yes PRESSURE: No REACTIVITY: No ACUTE: Yes CHRONIC: Yes

6. SUGGESTED FIRST AID

EYE CONTACT:
Immediately flush eyes with plenty of water. Continue for 10 minutes
holding eyelids open. Call a physician.

SKIN CONTACT:
Wash affected area with soap and water.

INHALATION:
If symptoms occur, remove person to fresh air. If symptoms continue,
call a physician.

IF SWALLOWED:
Do not induce vomiting. If person is conscious give one to two
glasses of water. Immediately call a physician.

### MATERIAL SAFETY DATA SHEET

**MSDS: SCOTCH-SEAL(TM) BRAND CHEMICAL GROUT 5600 (FOAM)**

**JANUARY 3, 1992 PAGE: 3 of 4**

### 7. PRECAUTIONARY INFORMATION

**OTHER PRECAUTIONARY INFORMATION:**

Keep away from all sources of ignition. Avoid contact with eyes, skin, and clothing. Wear safety glasses or chemical goggles, butyl rubber gloves and long sleeved clothing. Launder contaminated clothing before reuse. Wash thoroughly after handling. Avoid breathing vapor. Provide ventilation sufficient to maintain vapor concentrations below recommended exposure limits. Keep container tightly closed when not in use. Store in a cool, dry area away from combustible materials and alcohols. Keep out of the reach of children. For professional use only.

RE: File Number 6-14AE883

Dear Ms. Adams:

Based on information submitted, the product listed below is acceptable as a grout for repair of leaking joints and cracks in potable water applications when used within the conditions stated below:

Product: Scotch-Seal Brand Chemical Grout 5600 (foam)

Conditions:
1. The product is properly applied according to the manufacturer's specifications.
2. The product continues to meet the specifications of good manufacturing practices.
3. After complete curing, the surface is thoroughly rinsed with potable water prior to being placed in service.

We would not anticipate any adverse health effects resulting from such use of this product assuming the product continues to meet the supplied specifications.

We are currently in the process of revising our evaluation procedures as outlined in the Federal Register, Vol. 44, No. 141, 42775-8, Friday, July 20, 1979. When these revisions are completed and the interim procedures are in place, all existing advisories will be periodically reviewed.
Our opinion concerning the safety of the product does not constitute an endorsement, nor does it relate to its effectiveness for the intended use. If this letter is to be used in any way, we require that it be quoted in its entirety.

Sincerely yours,

QUARTERLY PROGRESS REPORT

to the

NATIONAL COOPERATIVE HIGHWAY RESEARCH PROGRAM

on Project

TRB 21-4

Sealing Geotechnical Exploratory Holes to Protect the Subsurface Envi

for period

July 1, 1991 to September 30, 1991

from

STRATA ENGINEERING CORP.
1.0 INTRODUCTION

This constitutes the Second Quarterly Progress Report on TRB Project 21-4. It contains a description of research accomplishments to date and provides an overview of planned research into the fourth quarter, October 1 to December 31, 1991.

1.1 Research Problem Statement

Geotechnical exploratory holes often penetrate water-bearing formations. There is concern that these holes can become conduits for contamination, comminglings or loss of groundwater. To protect the subsurface environment, geotechnical organizations are being asked by water-resource agencies to use water-well drilling techniques and regulations that are not necessarily applicable to routine geotechnical practices. Moreover, the use of water-well drilling methods and machinery for geotechnical exploration results in considerably higher costs to geotechnical organizations (including highway agencies) to modify procedures and obtain new equipment. Research is needed to develop suitable seals, which will adequately protect the subsurface environment, for closure and for installation of instruments in small diameter geotechnical exploratory holes.

1.2 Scope of Problem

Such exploratory holes, whether bored or created by displacement techniques, constitute a potential conduit for contamination of the subsurface environment if they are not properly sealed. They can also lead to loss of groundwater, such as uncontrolled artesian flow. It is therefore important to return the subsurface environment to its pre-drilling condition by providing cost-effective and verifiable seals in important zones of the subsurface stratigraphic column.

Current methods of sealing water well holes and abandoned wells are not appropriate for geotechnical exploratory holes due to differences in size and depth of the holes, original purpose of the holes, and their intended functions, time constraints, and costs. Hence, specific solutions must be found for sealing geotechnical exploratory holes made for transportation-related activities.

Often, geotechnical exploratory holes are instrumented for short or long-term observations of settlements, pore pressures, and lateral movements. The space available within such holes is insufficient for effective sealing against contaminant migration or commingling is much less than for un-instrumented holes. This fact, combined with the variety of materials used in instrumented holes (from PVC to steel, cables, wires, etc.) leads to complex conditions for which traditional sealing methods may not be suitable for adequate protection of the environment.

The increasing deployment of in situ soil testing techniques such as piezometers, cone penetrometers, and dilatometers requires that attention be also paid to these small diameter displacement type holes, which traditionally have not been deliberately backfilled or sealed against contamination. Hence, the sealing methods to be developed must address both conventional geotechnical boreholes and small diameter in situ testing holes.

2.0 OBJECTIVES OF RESEARCH

2.1 Goals

The broad objectives of this research are to develop (1) technical guidelines for materials and methods for placing seals in instrumented holes and for decommissioning small-diameter geotechnical exploratory holes in order to protect groundwater from contamination and loss, and (2) methods for verification of these seals.

The focus of this research is therefore to determine viable, economical, effective and verifiable seals and sealing methods to protect the subsurface environment from geotechnical exploratory holes made by common drilling and in situ testing methods.
2.2 Specific Objectives
The specific objectives of this research are:

1. To test, in the laboratory and in the field, sealing materials and methods for use in instrumented and un-instrumented holes compatible with pre-exploratory subsurface conditions and for normal drilling and in-situ testing practices;

2. To recommend procedures for effective and economical decommissioning of geotechnical exploratory holes in order to protect the subsurface environment and to control water loss;

3. To develop practical guidelines for material selection and methods to place effective seals in instrumented and un-instrumented geotechnical exploratory holes;

4. To develop and test procedures for seal verification.

2.3 Tasks
The following tasks are included in the research:

Task 1. Summarize the state of the practice in small diameter geotechnical exploratory holes. The summary shall include a list of viable seals using readily obtainable materials for both instrumented and un-instrumented holes.

Task 2. Using the list developed in Task 1, develop and perform a testing program for the viable seals. The type and extent of testing of the sealing systems should be sufficient to evaluate: (a) the effectiveness and limitations of each sealing material; (b) the long term performance of each seal; (c) the performance of each seal when subjected to naturally occurring salts, minerals, acids and the like; (d) the influence of seal thickness (vertical dimension); (e) the ability to satisfy completely seal small annular spaces in instrumented holes; (f) the constructability of each seal type, above and below groundwater, in artesian conditions, and at various depths below the ground surface to a maximum depth of about 200 feet (60m); and (g) the influence of various geological conditions on the performance of each seal type.

Task 3. Develop procedures to verify that the seal in situ will perform as intended.

Task 4. Develop comprehensive guidelines for sealing geotechnical exploratory holes. This would include seal design procedures, schematics showing each seal design, specifications for each seal material, suitable placement techniques, and verification procedures.

Task 5. Prepare a final report describing the research performed and presenting the comprehensive guidelines. Sufficient research results must be included in the report to conclusively justify the recommended guidelines.

3.0 WORK PLAN
The research is being conducted in eight phases, as summarized below. Details of the work to be performed in each phase have been submitted earlier with the Work Plan for the project.

Phase 1 - Review of Current State of Practice and Policies
Phase 1 is intended to gather information on current policies and practices from a number of public and private jurisdictions and agencies/departments involved in geotechnical exploration activity. This information will form a basis for the specific design of seal testing programs both in the laboratory and in the field. Attention will be paid to reported problems with current practices.

Phase 2 - Detailed Literature Review
This phase will be conducted simultaneously with Phase 1. A review of current literature on the subject of hole sealing will include practices from the oil and water well drilling industries, from current thinking on sealing nuclear waste vaults and chambers and from work underway in providing leachate barriers at landfill sites.
Phase 3 - Laboratory Testing
Phase 3 comprises laboratory testing of various sealing materials and investigation of potential methods to achieve effective seals under a variety of controlled laboratory conditions to determine their viability for field applications. This work will be done in two stages. Stage 1 will consist of fabrication of the testing apparatus and trial testing to ensure its operational validity. Stage 2 will consist of tests to simulate field sealing applications, using a variety of sealing materials and methods.

Phase 4 - Field Installations
In this phase, the three field sites at Amherst, Iowa, and Ottawa (Canada) will become operational for drilling, sampling, and placement of seals.

Phase 5 - Field Seal Testing
Field testing programs will be initiated to place seals in selected holes and soil types (drilled, displacement, augur-instrumented, un-instrumented). Costs associated with seal installation will be monitored (supplies, drill rentals, manpower).

Phase 6 - Seal Verification
In this phase, field tests will be conducted on the installations of Phase 5 to verify the seals are operating as intended. Test pits will be placed adjacent to the holes at one of the three sites (to be determined upon completion of Phase 3).

Phase 7 - Development of Comprehensive Hole Sealing Guidelines
In this phase, feasible and practical guidelines will be developed for use by drilling contractors and agencies involved in geotechnical exploratory activities.

Phase 8 - Final Report
Draft and final reports of the research will be prepared and submitted.

SECOND QUARTER PROGRESS - SUMMARY
Progress made during the second quarter (July 1 to September 30, 1991) is reported in summary form in this section. Details are found in the cited Appendices following the Tables and Figures.

4.0 PHASE 1 - REVIEW OF CURRENT STATE OF PRACTICE AND POLICIES

4.1 Introduction
Phase 1 of the project is intended to gather existing information on current regulatory policies and practices regarding the sealing of exploratory holes. In order to provide a broad view of the problem, solicitations were made to a number of public and private jurisdictions and agencies or departments involved in geotechnical and other soil exploration activities. This information will be used in part to form a basis for the specific design of prototype seal testing programs both in the laboratory and in the field and will also provide essential background on the current (1991) state-of-the-practice.

4.2 Objectives
The objectives of the borehole sealing practice survey are to:

1. Obtain a reasonably accurate indication of the current state-of-the-practice of sealing exploratory holes,
2. Determine the current status of regulations regarding sealing of exploratory holes, and
3. Determine if any innovative sealing or performance monitoring techniques are being used in practice.

4.3 Approach
Two approaches were implemented to obtain information on current practices. The first approach consisted of a letter campaign requesting current regulations, recommendations, and/or guidelines for sealing/backfilling geotechnical exploratory holes. Because regulations may depend on local or regional variations in geology, groundwater conditions and drilling procedures, requests were made to each state within the United States and each province in Canada. In the U.S. letters were sent to:

Appendix B Compendium of State Grout Requirements
52 State Departments of Transportation,
29 State Geological Surveys,
32 State Departments of Natural Resources, and
24 State Departments of Environmental Quality/Protection.

Since there is some overlap of agencies within each state, every state did not receive four enquiries.

The second approach consisted of a general mailing of a Borehole Sealing Practice Questionnaire requesting information on current procedures used by individual practitioners for sealing backfilling geotechnical exploratory holes. A detailed borehole sealing practice survey, shown in Appendix I, was prepared to solicit and collate information on existing practice. These questionnaires were sent to: (1) practising geotechnical engineers, obtained from the Association of Soil and Foundation Engineers (ASFE) Membership List and the Consulting Engineers Council Directory, and (2) environmental drilling consultants and contractors, obtained from a directory published in the Spring 1990 issue of Ground Water Monitoring Review.

4.4 Results

4.4.1 Current Regulations

The shaded states shown in Figures 1 to 4 are based on individual state organizations and indicate states in which responses to the request for current regulations were received. Responses were received from:

49 State Departments of Transportation,
16 State Geological Surveys,
13 State Departments of Natural Resources, and
13 State Departments of Environmental Quality/Protection.

Tables 1 to 4, which are also based on individual state organizations, present typical sealant mixtures that the states employ. The most common sealant mixtures used by all organizations are:

1. Bentonite,
2. Cement,
3. Cement-Bentonite,
4. Cement-Sand, and
5. Concrete.

A typical bentonite mixture consists of 1-2 pounds of bentonite per gallon of water. The mixture shall be of sufficient viscosity to require a time of at least 60 seconds to discharge 1 quart of material through an American Petroleum Institute (API) mark F viscometer.

A typical cement mixture is composed of 1 bag of portland cement per 5-6 gallons of water. The cement-bentonite mixtures have the same cement-water proportioning with 2-4 pounds of bentonite added.

A typical cement-sand mixture is composed of 1 bag of portland cement per 5-6 gallons of water to which not more than 2 parts sand to 1 part cement may be added. The concrete mixture is in the same proportions as the cement-sand mixture but has gravel of crushed stone as a part of the sand additive.

Appendix II contains a detailed summary of each state's practices on an organizational basis.

Current regulations/guidelines enforced by state Departments of Transportation may be divided into three broad categories as follows:

1. No written regulations,
2. State requires that the Department of Transportation's regulations be followed, and
3. State requires that another state agency, besides the Department of Transportation, regulations be followed.
The shaded areas in Figures 5 to 7, which are based on these three categories, indicate the states that follow a particular category. Table 3 summarizes all of the state Departments of Transportation practices. Appendix III contains a detailed summary of each state's practices based on the three categories.

4.4.2 Current State-of-Practice

The shaded areas in Figure 8 indicate the states in which consultants have responded to the borehole sealing practice survey. Practice surveys were sent to 407 practicing consultants in the U.S. A total of 49 replies were received for a response success of 12%. Based on geographic region, responses were received from:

- 13 Northeast states,
- 6 Southeast states,
- 12 Midwest states,
- 2 Northwest states, and
- 16 Southwest states.

While the total number of responses is low, the distribution should give a reasonable assessment of current practice. Table 6 is a detailed question by question statistical breakdown of the responses received by the U.S. consultants. It is interesting to note that 31% of the U.S. consultants are aware of existing guidelines or regulations pertaining to sealing geotechnical exploratory holes and 63% have an "in-house" policy regarding the sealing of the holes. This information is encouraging and suggests current trends in environmental awareness. Based on the responses from the surveys, the current state-of-practice of sealing boreholes appears to be:

1. Seal the borehole with bentonite-cement.
2. Backfill the borehole with native soil cuttings.
3. Seal the borehole with bentonite, and
4. Seal the borehole with cement.

These practices are given in order of decreasing use. Appendix IV contains a detailed summary of the responses received by the U.S. consultants.

Surveys were sent to 295 various Canadian sources and 35 replies were received, for an average response of 13.6%. Table 7 and 8 are detailed question by question statistical breakdown of the responses received by the Canadian consultants and also the Canadian government agencies. Table 9 is a further breakdown of responses by provinces and category of respondents. It is interesting to note that only 8.3% of the Canadian consultants and contractors are aware of existing guidelines or regulations pertaining to sealing geotechnical holes as opposed to the 31% of U.S. consultants. Also, only 33.3% have an "in-house" policy regarding the sealing of holes as opposed to the 63% of U.S. consultants.

5.0 PHASE 2 - DETAILED LITERATURE REVIEW

A detailed literature review, to obtain information on the hydraulic conductivity of selected borehole sealants, especially bentonite, is in progress. A wide spectrum of literature topics are being reviewed such as:

- Influence of permeants upon the permeability of bentonite,
- Cement-bentonite slurries,
- Annular space material for wells,
- Decommissioning and abandonment of water wells,
- Pore pressure changes due to bentonite pellet seals, and
- Proprietary borehole sealing products and processes.

Appendix V contains a list of references that have been obtained thus far.

Additionally, an extensive literature search has taken place and continues on laboratory methods to measure hydraulic conductivity. Particular interest is focused on apparatus and factors which affected the measured hydraulic conductivity of a soil in laboratory tests. Factors include the effects of permeant, gradient, microorganisms, type of permeameter, sample preparation, saturation and air entrapment.

Table 6. Statistical Summary of United States Responses.

Note: All percentages based on 49 surveys unless otherwise stated. 407 surveys were sent out - 12.0% surveys were returned.

Part I - Current Policy
1. Aware of any existing guidelines or regulations pertaining to sealing geotechnical exploratory holes:
   - Yes 51.0%
   - No 46.9%
   - No response 2.0%

2. Aware of any published guidelines for sealing geotechnical exploratory holes:
   - Yes 30.6%
   - No 65.3%
   - No response 4.1%

3. Currently have an "in-house" policy regarding sealing of geotechnical exploratory holes:
   - Yes 63.3%
   - No 32.7%
   - No response 4.1%

4. Constrained by current environmental protection policies or legislation in performing tasks related to transportation related geotechnical exploration activity involving sealing:
   - Yes 4.1%
   - No 89.8%
   - No response 6.1%

5. Prevented from drilled exploratory holes due to concerns with sealing the holes to prevent potential contamination of the subsurface environment:
   - Yes 14.3%
   - No 83.7%
   - No response 4.1%

6. Verification of hole sealing a requirement of either the current regulatory or in-house policy:
   - Yes 26.5%
   - No 71.4%
   - No response 2.0%

Environmental Assessment of Selected Cone Penetrometer Grouts and a Tracer

Thomas D. Wright

U.S. Army Engineer Waterways Experiment Station
Environmental Laboratory, 3909 Halls Ferry Road
Vicksburg, MS 39180-6199

Selected grouts and a tracer were evaluated for the potential to contaminate groundwater at hazardous and toxic waste sites. The grouts and tracer were proposed for use with the SCAPS penetrometer. Using a risk assessment approach, it was concluded from the effects phase that contamination was unlikely. Hence, the exposure phase was not necessary.
