# Title

In Vivo Effects of Oxygen at Varying Pressures on Erythrocytes and Brain.

## Authors

Charles E. Mengel, M.D.

## Performing Organization Name and Address

University of Missouri
Columbia, Missouri 65201

## Controlling Office Name and Address

Procuring Contracting Officer
Office of Naval Research 300 N. Quincy
Department of the Navy Arlington, Va.

## Monitoring Agency Name & Address (if different from Controlling Office)

Office of Naval Research Resident Rep.
Park Hill Plaza
2326 Louisiana Street
Lawrence, Kansas 66044

## Distribution Statement (of this Report)

Biological and Medical Sciences
Hyperbaric Physiology

APPROVED FOR PUBLIC RELEASE; DISTRIBUTION UNLIMITED

## Distribution Statement (of the abstract entered in Block 20, if different from Report)

N.A.

## Supplementary Notes

None

## Key Words

Hyperoxia, hyperbaric oxygen, red cells, brain

## Abstract

See attached
SUMMARY REPORT

CONTRACT N00014-67-A-0287-0009

OFFICE OF NAVAL RESEARCH
1965-1976

In Vivo Effects of Oxygen at Varying Pressures on Erythrocytes and Brain
The following is a list of the major scientific accomplishments achieved under support of this contract. Details of all of them are to be found in the publications derived from these studies.

1. First evidence of hemolysis in a human after exposure to oxygen under high pressure (OHP).

2. Evidence for a relationship between in vivo tocopherol status and central nervous system toxicity (seizures) during exposure to OHP.

3. Demonstration of in vivo inhibition of RBC cholinesterase by OHP and definition that it was due to peroxides.

4. First proof of in vivo peroxidation of lipid in RBCs (produced by hyperoxia).

5. Description of changes in RBC glycolytic intermediates due to OHP and associated enzyme changes.

6. Determination of the exact biochemical and functional events leading to in vivo destruction of RBCs by hyperoxia.

7. First evidence for in vivo consumption of tocopherol during exposure to hyperoxia.

8. Demonstration of in vivo changes in fatty acid composition of RBCs induced by hyperoxia and their relation to RBC destruction.

9. Evidence that hyperoxia of any degree could produce hemolysis if prolonged enough.

10. Demonstration of changes in WBCs produced by hyperoxia.

11. Effects of drugs on susceptibility of tissues (RBCs and brain) to hyperoxia.

12. Role of circadian rhythm in susceptibility to hyperoxic seizures.
13. Proof of in vivo production of \( \text{H}_2\text{O}_2 \) in RBCs and brain during exposure to hyperoxia.

14. Proof that senescent RBCs were those most susceptible to in vivo hyperoxia.

15. Study of factors that influence oxygen transport of RBCs.

16. Effect of drugs on red cells in humans that might influence susceptibility to hyperoxia.
