# Sensor Integration for Small Arms Smart Munitions

What advantages can a Small Arms Smart Munition offer to the 21<sup>st</sup> Century Soldier?

- Increased Lethality (High Probability of Incapacitation, P(I) )
- Simplicity in Operation (Locate Target, Point, Fire and Forget, not laser designated)
- Effective For Multiple Enemy Positions (Moving, Stationary, in Defilade)
- Lightweight Weapon System (Soft-launched autonomous munition)

## Projectile Sensor Requirements

Small Size, Low Weight  
Passive Operation in Day & Night  
Sensitivity (*Range dependent*)  
Response Time (*Velocity dependent*)  
Autonomous Target Detect and Engagement  
Low Power  
Easy to Manufacture

USER

FLIGHT PATH

Sensor On-Board

MUNITION

AIR BURST

SENSOR FIELD OF VIEW

# Concept of Operation For Small Arms Smart Munition

## Sequence of Events on the Fire Control System (individual weapon)

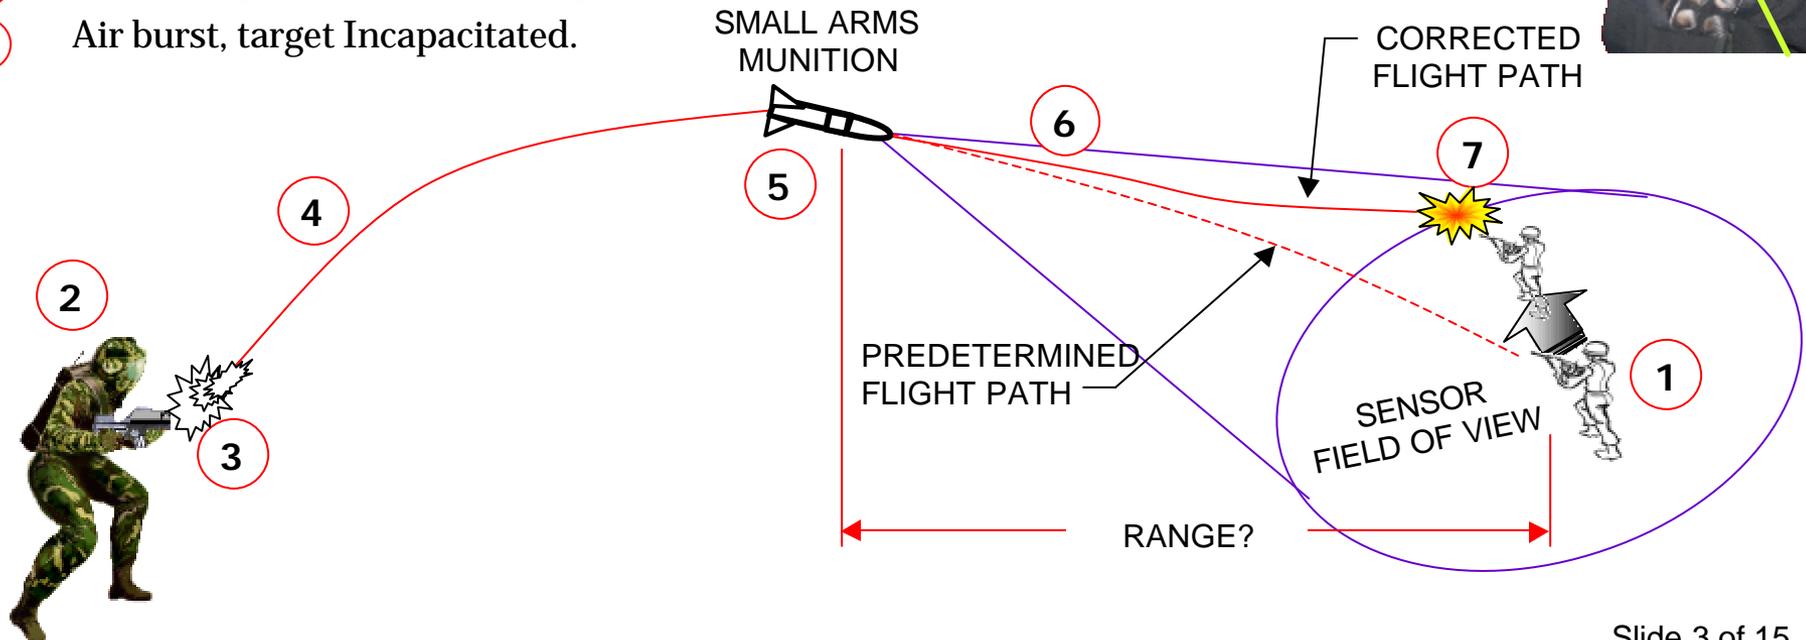

- Detect target and Acquire target location information.
- Compute flight trajectory, target image(s), Download to munition.
- Elevate weapon, Soft-launch munition.

## Sequence of Events on the Small Arms Munition

- Follow predetermined flight path to known target location.
- Activate sensor and Look for target.
- Detect target, Maneuver to target.
- Air burst, target Incapacitated.

## 21<sup>st</sup> Century Visionary Soldier

- Individual Weapon
- Electronic Compass
- Laser Rangefinder
- Infrared Sensor

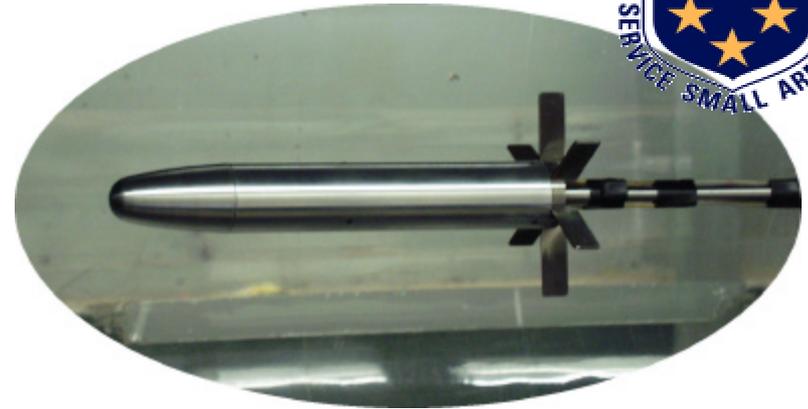

# Light Fighter Lethality (LFL) Small Arms Smart Projectile Example

**Need Munition Characteristics to Focus Sensor Development/Specifications**

**Propose the Light Fighter Lethality (LFL) Seeker Projectile being developed by JSSAP**

- Fin Stabilized – Maximum Spin Rate: 6 Hz
- Diameter: 25.0 mm
- Length: 165 mm (6.1") unfolded
- Weight Goal: 0.5 lbs
- Maximum Flight Velocity: 160 m/s
- Maximum Engagement Range: 500 m
- Time of Flight: 4 s
- Target Type: Personnel in Body Armor

**Based on above, Propose Using a 8-12 micron Uncooled Staring Microbolometer Sensor**

Advantages:

- + Small Size (no scanning)
- + Low Weight, Low Power (with no TE cooler)
- + Passive, All Weather Operation
- + Medium to High Sensitivity
- + Manufacturing Processes Improving

Disadvantages

- Not Spin Insensitive (current pixel design)
- Non-Uniformity Correction (Calibration)
- Sensor Noise
- Thermoelectric (TE) Cooling currently

# Sensor Development Outline

**GOAL:** Detect a personnel target with high probability early in projectile flight to provide adequate range and time for maneuvering.

**FIRST:** Determine the suitable Field of View (FOV) for the optics to fully contain the target based on projectile flight path. Concurrently, design external profile to satisfy aerodynamic stability. (slide 6&7)

**SECOND:** Optimize sensor array size for the given FOV and determine appropriate focal length to satisfy projectile physical constraints. (slide 8)

**THIRD:** Determine thermal time constant to minimize image degradation induced by projectile spin rate. (slide 11)

**FOURTH:** Determine detector sensitivity required to resolve target at sensor turn-on range. (slide 12)

**FIFTH:** Predict detector sensitivity and thermal time constant values necessary to achieve a 70% probability of detection for a personnel target to satisfy the LFL application. (NVTherm Model) (slide 13)

**SIXTH:** Identify any issues associated with the sensor development results. (slide 14)

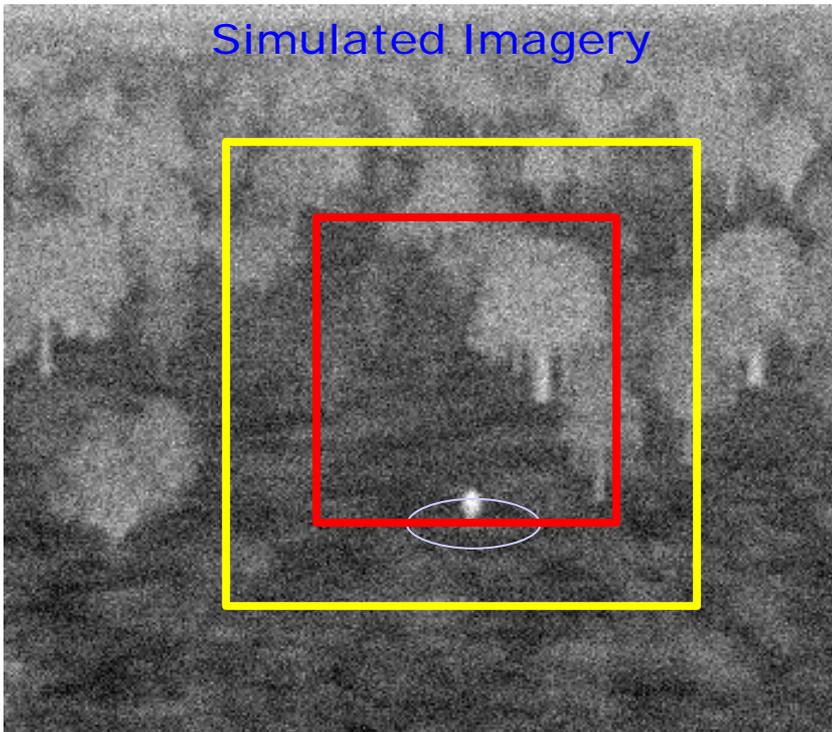

# Field Of View (FOV) Analysis at Sensor Turn-On

(Range: 265m, Altitude: 16.8m,  $-0.11^\circ$ , TOF: 2.2sec)

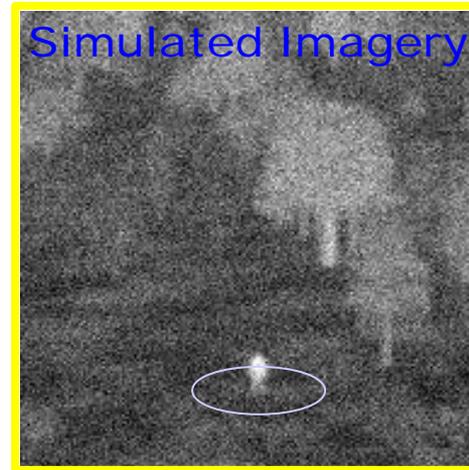

Range to Target is 235 m

Simulated Imagery

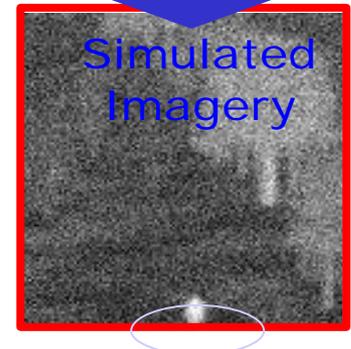

*~10° Field of View*

Circle is how far target could have run in the elapsed time from initial target acquisition to sensor turn-on.

*8° Field of View*

Requires Decreasing Projectile Altitude Or Later Turn-On!

*6° Field of View*

## Field of View Must Encompass

- Target upon turn-on without affecting projectile flight.
- Distance the target can run in available time.
- Errors associated with the targeting devices (such as the laser rangefinder, digital compass).
- Errors associated with projectile flight trajectory.

**10° Is Excessive, 6° Is Too Small in Azimuth, 8° Is Sufficient.**

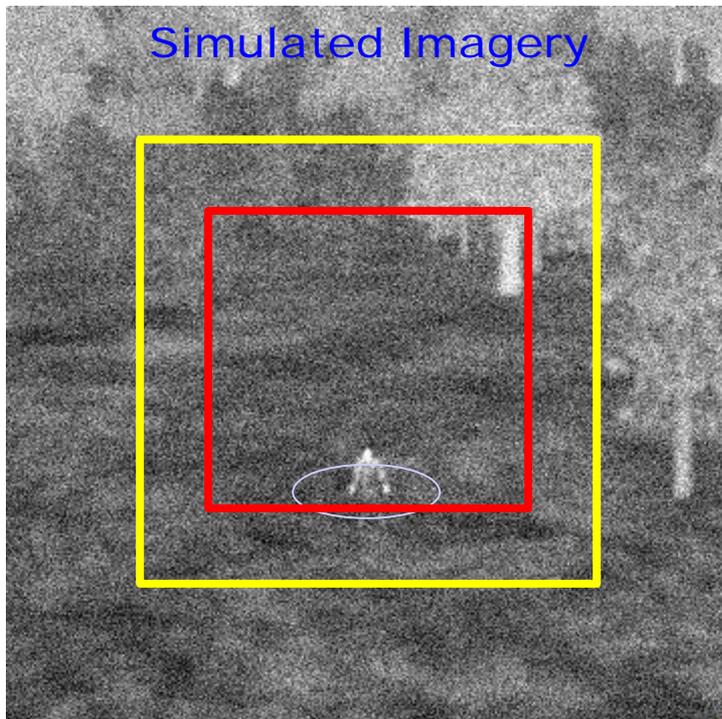

# Field Of View (FOV) Analysis at Closer Range to Target

(Range: 413m, Altitude: 10.8m, -4.7°, TOF: 3.3sec)

Distance to Target is 87 m  
Time to Impact is 0.7 sec

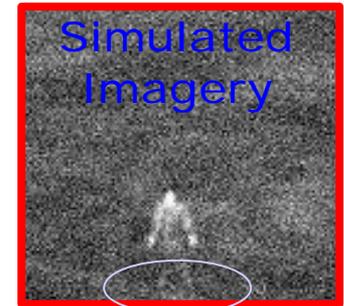

Simulated Imagery

*~10° Field of View*

Simulated Imagery

*8° Field of View*

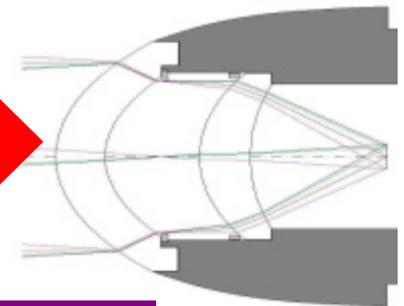

Simulated Imagery

*6° Field of View*

Circle indicates how far the target can run before the projectile reaches the target.

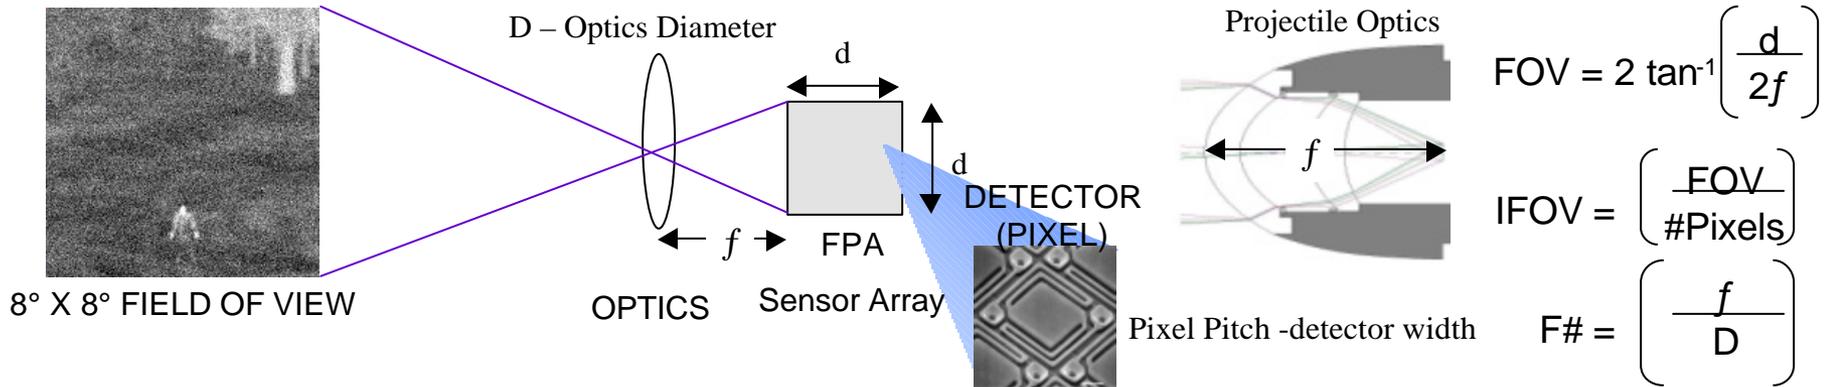

**External Profile Satisfies Aerodynamic Stability Factors**

**Shorter Range to Target Reduces Amount of Scene Coverage  
In Addition to Time Available for Projectile Course Correction**

# Focal Plane Array (FPA) Optimization Analysis

Determine Appropriate Focal Plane Array Size to Best Resolve the Required Field of View.

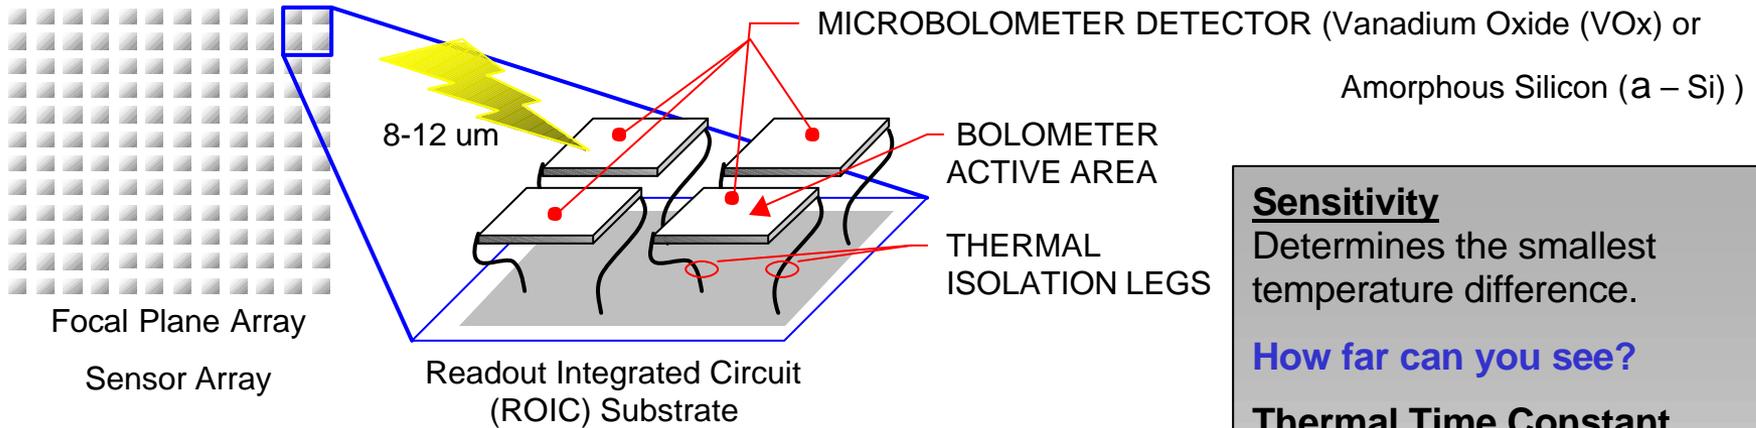

Dependent On:

- |                            |             |  |  |
|----------------------------|-------------|--|--|
| • Number of Detectors      | Many        |  | Higher Resolution, Small IFOV          |
|                            | Few         |  | Lower Resolution, Large IFOV           |
| • Pixel Pitch              | Large       |  | Large FPA Size, Long Focal Length (f)  |
|                            | Small       |  | Small FPA Size, Short Focal Length (f) |
| • Processing Consideration | Many Pixels |  | More Image Processing per pixel        |
|                            | Few Pixels  |  | Less Image Processing per pixel        |

**Desire The Most Compact Optical System That Sufficiently Resolves The Target.**  
**Result: 64 x 64 FPA, 25 μm pixel pitch, 11.5 mm (0.45") focal length, 0.13° IFOV, 0.9 F#.**

# Microbolometer Detector Operation and Characteristics

## Microbolometer Detector Operation

- Active Area absorbs incoming Infrared (IR) energy.
- IR energy produces a change in detector resistance across legs.
- Resistance change is sensed by integrating bias current or voltage.
- Resulting detector signal is read out and digitized.

The larger the change in resistance, the more IR energy was absorbed, and the thus the “hotter” the target.

### Sensitivity

Determines the smallest temperature difference.

### How far can you see?

### Thermal Time Constant

Determines detector speed of response by the following equation:

$$t_{th} = C / G$$

where C = Thermal Heat Capacity (J/K)

G = Thermal Conductance (W/K)

### How fast can you see it?

**Sensitivity and Thermal Time Constant are Inversely Proportional Based on Material Properties, Thermal Mass and Physical Geometry.**

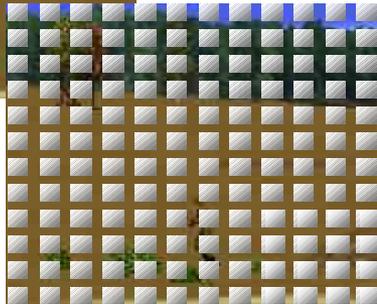

# Issue of Projectile Spin on Sensor Effectiveness

## NO PROJECTILE SPIN

Visible Scene

Scene Imaged by Static FPA

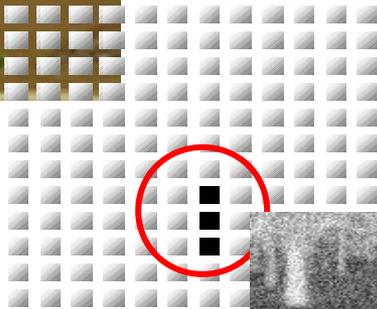

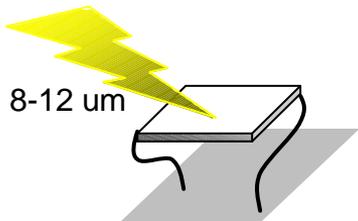

Image Readout

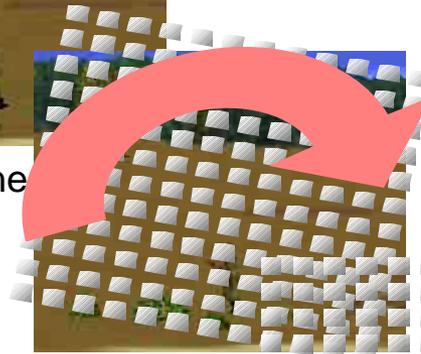

Thermal Image

IR Energy Contained within the IFOV is Absorbed by the bolometer.

Visible Scene

Scene Imaged by Rotating FPA

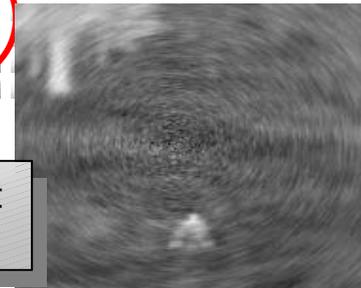

6 Hz Spin = 2160° rotation/second

For single detector with  $\tau_{th} = 10ms$ , scene IFOV rotates by **21.6°!!!**

*Target Contrast Decreased!  
Aspect Ratio Changes!*

Image Readout

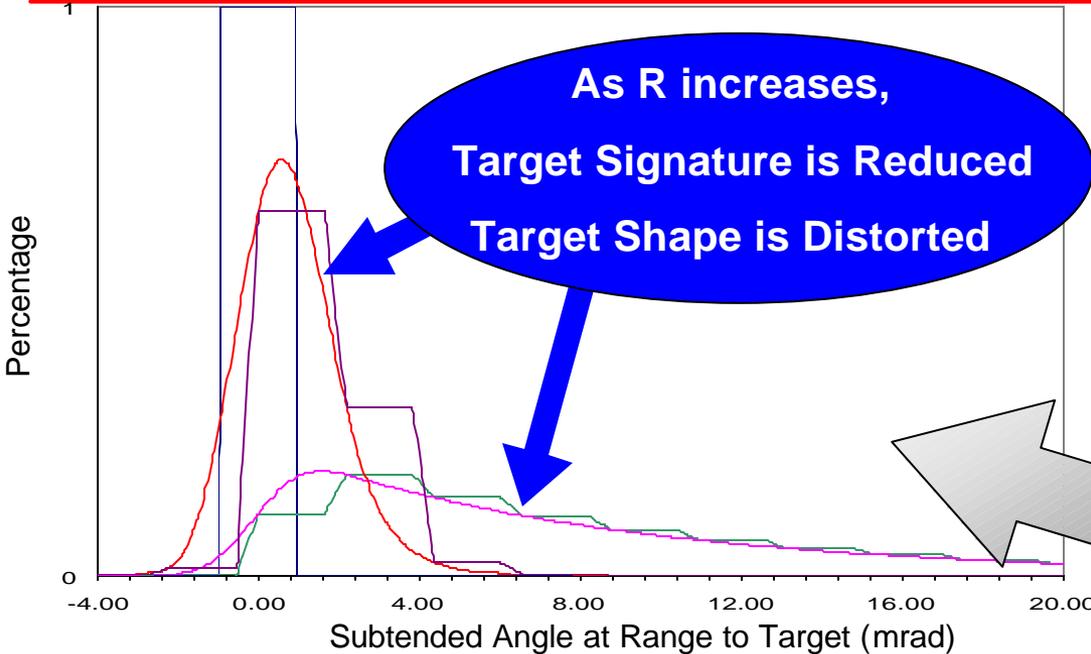

Effect worsens at FOV extremes.

Thermal Image

# Projectile Spin Analysis (cont'd)

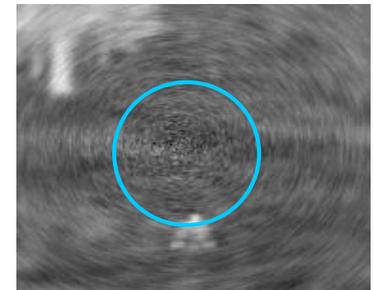

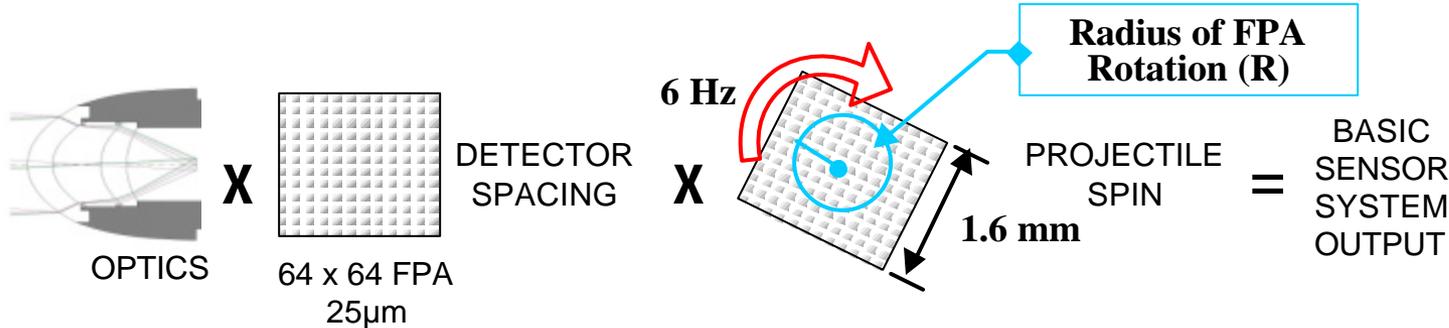

- Target
- Optics + Det + Spin (R = 0.04mm)
- FPA Output (R=0.04mm)
- Optics + Det + Spin (R = 0.4mm)
- FPA Output (R = 0.4mm)

Sensor Parameters:  
 Field of View: 8° x 8°  
 Array Size & Pixel Pitch: 64 x 64, 25µm  
 Thermal Time Constant = 1.5ms  
 Range of Target = 234m

As Seen Above, Effect Worsens With Larger Radii of FPA Rotation (R).

With Thermal Time Constants ( $t_{th}$ ) > 1.5ms, The Result is More Dramatic.

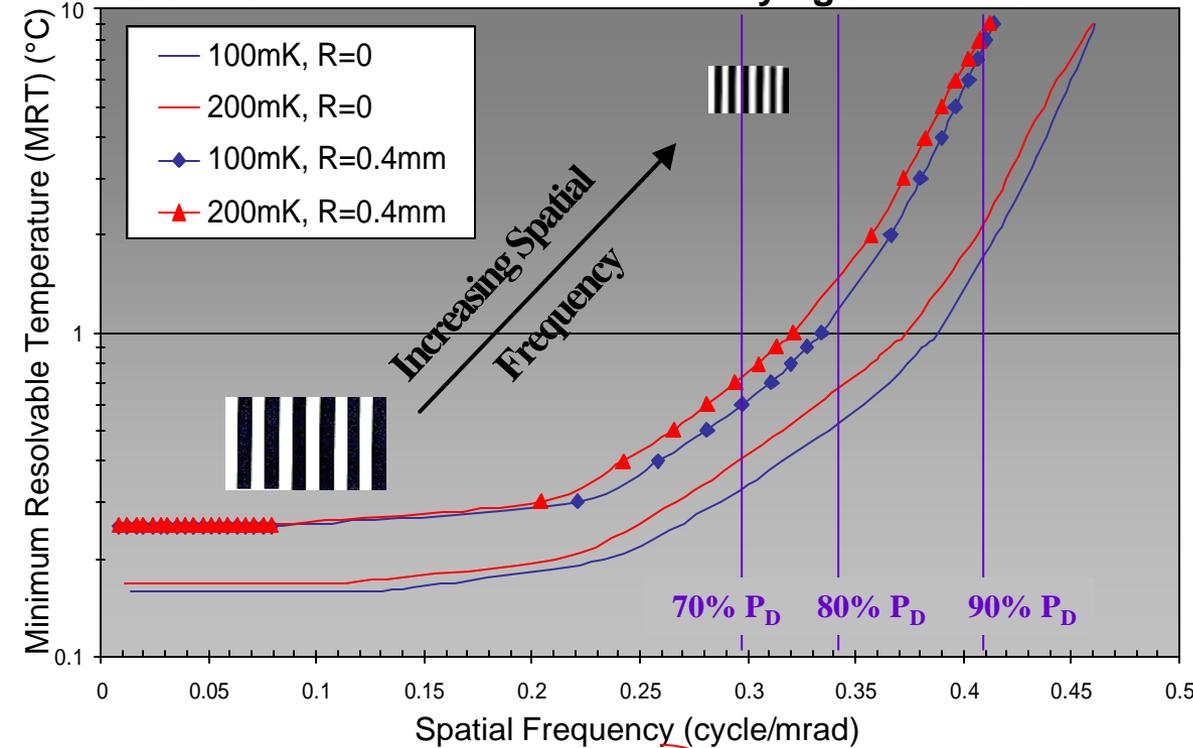

Thermal Image Representation

# Required Sensor Performance at Sensor Turn-On Range (234m to target)

2-D MRT Performance Chart for Varying Detector Sensitivities

MRTD is the minimum temperature difference between a standard target and the background that is required in order for a standard observer to just fully resolve the target. It is the best overall indicator of thermal imager system performance.

- FLIR92 Thermal Imaging Systems Performance Model, NVESD, Fort Belvoir, VA, Jan 1993.

Sensor 2-D MRT

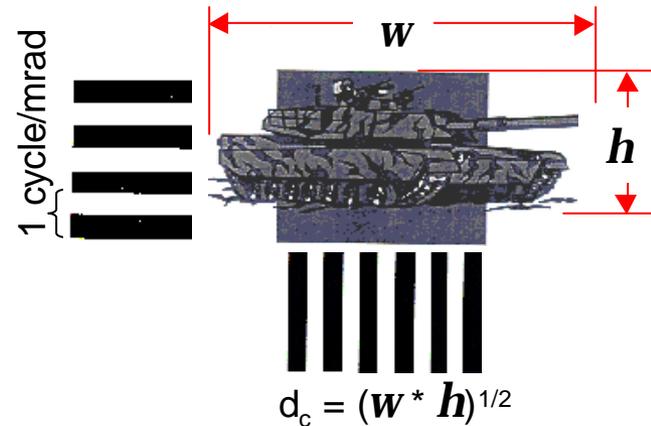

Atmospheric Transmission ( $0.7\text{km}^{-1}$ )

Target-to-Background  $\Delta T$  ( $1.25^\circ\text{C}$ )

Target Critical Dimension ( $d_c$ ) ( $0.75\text{m}$ )

Plug into NVTherm Model, Output is a Range Performance Estimate for Probability of Detection

## Johnson Criteria

# Verify Sensor Parameters Through Sensor Performance Modeling

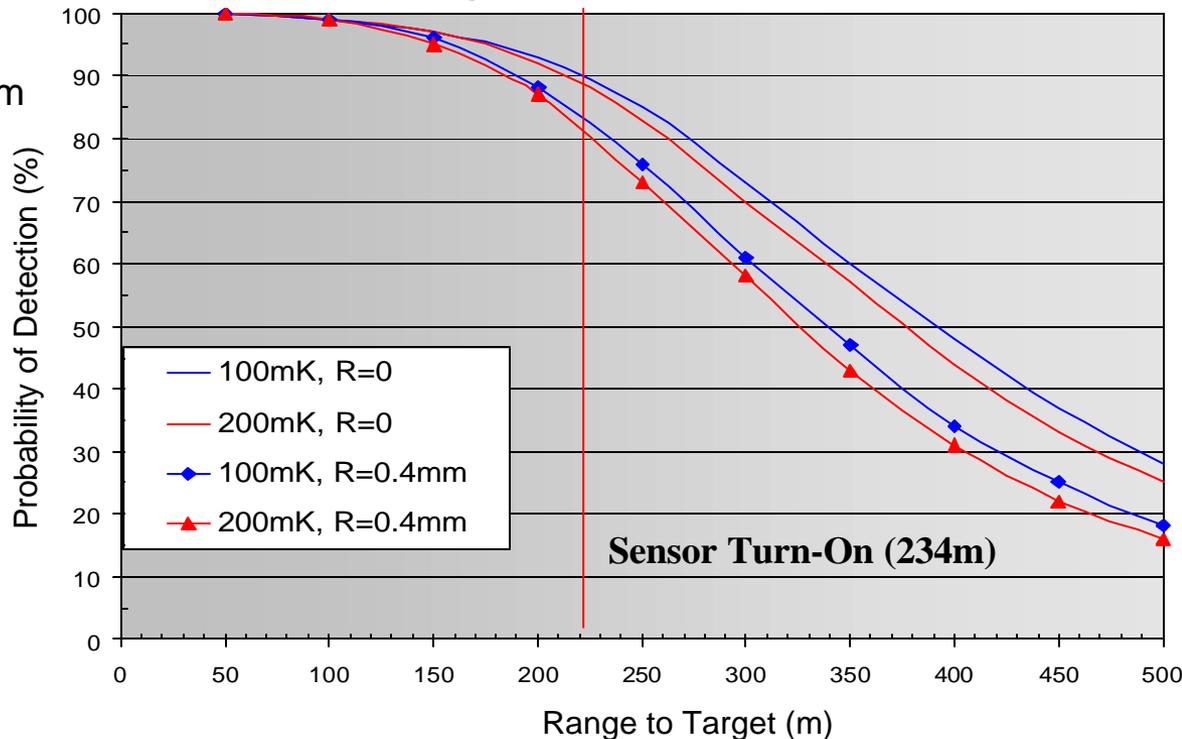

## Sensor Parameters

Focal Plane Array Size	64 x 64 pixels
Detector Sensitivity	100-200mK (f/1 @30Hz)
Thermal Time Constant	1.5ms (minimum)
Pixel Pitch	25μm
Field of View	8° x 8°
Focal Length	11.5 mm
F#	0.9

## Range Performance Estimates

Prob. of Detection	100mK	200mK
70%	270m-312m	260m-300m
80%	217m-233m	225m-262m

## Sensor Range Performance from NVTherm

NVTherm is a computer model that is used to estimate the performance of thermal imaging systems. It was developed by the CECOM RDEC Night Vision & Electronic Sensors Directorate (NVESD), Fort Belvoir, VA.

# Sensor Development Issues

## Factors Not Accounted For in Current Sensor Development:

- Software-in-the-loop operation for personnel target detection.
- Verify operational timelines can be satisfied through the interaction of the guidance and control unit to the automatic target detection process.
- Noise considerations(non-uniformity, fixed pattern noise).
- LFL Seeker Projectile flight errors on FOV optimization.
- Target aspect ratio based on projectile Angle of Attack (AoA).

## Impact

Moderate to High  
Moderate  
Moderate to Low  
Moderate to Low  
Low (<5° AoA)

## Factors Associated with NVTherm Range Performance Results

- Does not account for software-in-the-loop target detection. Moderate to High
- 70% Probability of Detection is conservative estimate for **man-in-the-loop**. Moderate

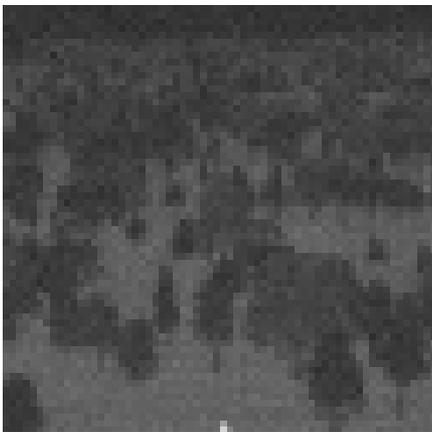

**Software-in-the-Loop Design Integration Will Be Addressed In Future Analysis. However, The Analysis To Date Still Proves That Sensor Parameters Can Be Adjusted To Satisfy The LFL Seeker Projectile Application.**

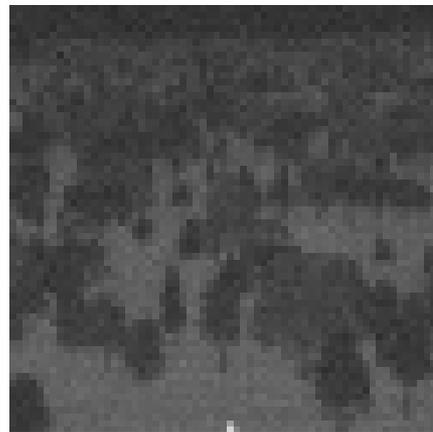

# Summary and Future Work

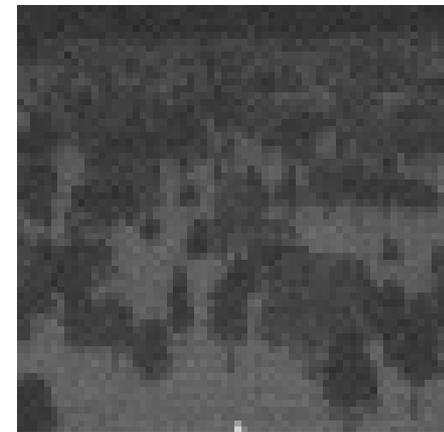

- Investigate Prototype Development of an Uncooled, Small Array Sensor for Use in Smart Munitions.
  - Revise Sensor Parameters To Consider Munition Guidance and Control Capabilities.
  - Uncooled Detector Technologies Have Improved In Recent Years (assuming reasonable temporal response and sensitivity requirements).
  - Electronics Required to Readout the Sensor Images Can Be Produced.
- Investigate Issues Associated with the Software-in-the-Loop issue for Automatic Target Detection.
- Continue Development of the LFL Seeker Projectile Sensor Simulation as a Sensor Analysis Tool.
